Side-effects dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes cheilitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-triglyceride concentration (risk of pancreatitis if triglycerides above 9 mmol/litre), raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentration, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; *rarely* mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal ideation)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; *very rarely* nausea, hepatitis, inflammatory bowel disease, gastrointestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hypertension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendinitis, arthritis, raised serum-creatine kinase concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments following long-term administration, visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vasculitis and granulomatous lesions, paronychia, hirsutism, nail dystrophy, skin hyperpigmentation, photosensitivity, increased sweating

Dose

- ADULT and CHILD over 12 years, 500 micrograms/kg daily increased if necessary to 1 mg/kg (in 1–2 divided doses) for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if failure or relapse after first course); max. cumulative dose 150 mg/kg per course

Isotretinoin (Non-proprietary) PoM

Capsules, isotretinoin 5 mg, net price 56-cap pack = £14.99; 20 mg, 56-cap pack = £39.99. Label: 10, patient information leaflet, 11, 21

Roaccutane® (Roche) PoM

Capsules, isotretinoin 10 mg (brown-red), net price 30-cap pack = £14.54; 20 mg (brown-red/white), 30-cap pack = £20.02. Label: 10, patient information card, 11, 21

13.7 Preparations for warts and calluses

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of **salicylic acid, formaldehyde, glutaraldehyde** or **silver nitrate** are available for purchase by the public; they are suitable for the removal of warts on hands and feet. **Salicylic acid** is a useful keratolytic which may be considered first; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation. An ointment combining **salicylic acid** with **podophyllum resin** (*Posalfilin®*) is available for treating plantar warts; severe systemic toxicity including gastrointestinal, renal haematological, and CNS effects may occur with excessive application of preparations containing podophyllum. Cryotherapy causes pain, swelling, and blistering and may be no more effective than topical salicylic acid in the treatment of warts.

SALICYLIC ACID

Indications see under preparations; psoriasis (section 13.5.2); acne (section 13.6.1); fungal nail infections (section 13.10.2)

Cautions significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

Side-effects skin irritation, see notes above

Dose

- See under preparations; advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

Cuplex® (Crawford)
Gel, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.23. Label: 15
Dose for plantar and mosaic warts, corns, and calluses, apply twice daily
Note Contains colophony (see notes above)

Duofilm® (Stiefel)
Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15
Dose for plantar and mosaic warts, apply daily

Occlusal® (Alliance)
Cutaneous solution, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56. Label: 15
Dose for common and plantar warts, apply daily

Salactol® (Dermal)
Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.71. Label: 15
Dose for warts, particularly plantar warts, verrucas, corns, and calluses, apply daily
Note Contains colophony (see notes above)

Salatac® (Dermal)
Gel, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £2.98. Label: 15
Dose for warts, verrucas, corns, and calluses, apply daily

Verrugon® (Ransom)
Ointment, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12
Dose for plantar warts, apply daily

With podophyllum

Posalfilin® (Norgine)
Ointment, podophyllum resin 20%, salicylic acid 25%, net price 10 g = £3.37
Pregnancy avoid—neonatal death and teratogenesis have been reported with podophyllum
Breast-feeding avoid
Dose for plantar warts apply daily
Note Owing to the salicylic acid content, not suitable for anogenital warts; owing to the podophyllum content, also contraindicated in pregnancy and breast-feeding

FORMALDEHYDE

Indications see under preparations

Cautions see under Salicylic Acid

Side-effects see under Salicylic Acid

Veracur® (Typharm)
Gel, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41.
Dose for warts, particularly plantar warts, apply twice daily

GLUTARALDEHYDE

Indications warts, particularly plantar warts

Cautions protect surrounding skin; not for application to face, mucosa, or anogenital areas

Side-effects rashes, skin irritation (discontinue if severe); stains skin brown

Dose

- Apply twice daily (see also under Salicylic acid)

Glutarol® (Dermal)
Solution (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

SILVER NITRATE

Indications warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation

Cautions protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

Side-effects chemical burns on surrounding skin; stains skin and fabric

Dose

- Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts *or* max. 6 applications for verrucas
  Note Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

Silver nitrate (Non-proprietary)
Caustic pencil, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 93p

AVOCA® (Bray)

Caustic pencil, tip containing silver nitrate 95%, potassium nitrate 5%, net price, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £1.94.

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. **Podophyllotoxin** (the major active ingredient of podophyllum) may be used for *soft, non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1).

Inosine pranobex (section 5.3.2.1) is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

IMIQUIMOD

Indications see under Dose

Cautions avoid normal or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients

Pregnancy no evidence of teratogenicity or toxicity in *animal* studies; manufacturer advises caution

Breast-feeding no information available

Side-effects local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; *less commonly* local ulceration and alopecia; *rarely* Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; *very rarely* dysuria in women; permanent hypopigmentation or hyperpigmentation reported

Dose

- Warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks)
- Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 days each week for 6 weeks; assess response 12 weeks after completing treatment
- Actinic keratosis, apply to lesion 3 times a week for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses
- CHILD under 18 years see *BNF for Children*

Important Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

Aldara® (Meda) PoM

Cream, imiquimod 5%, net price 12-sachet pack = £48.34. Label: 10, patient information leaflet

Excipients include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

Condoms may damage latex condoms and diaphragms

PODOPHYLLOTOXIN

Indications see under preparations

Cautions avoid normal skin and open wounds; keep away from face; very irritant to eyes

Pregnancy avoid

Breast-feeding avoid

Side-effects local irritation

Condyline® (Nycomed) PoM

Solution, podophyllotoxin 0.5% in alcoholic basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

Dose condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses; direct medical supervision for lesions in the female and for lesions greater than 4 cm^2 in the male; max. 50 single applications ('loops') per session (consult product literature); CHILD 2–18 years see *BNF for Children*

Warticon® (Stiefel) PoM

Cream, podophyllotoxin 0.15%, net price 5 g (with mirror) = £14.86

Excipients include butylated hydroxyanisole, cetyl alcohol, hydroxybenzoates (parabens), sorbic acid, stearyl alcohol

Dose condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm^2; CHILD 2–18 years see *BNF for Children*

Solution, blue, podophyllotoxin 0.5% in alcoholic basis, net price 3 mL (with applicators) = £12.38. Label: 15

Dose condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm^2; max. 50 single applications ('loops') per session (consult product literature); CHILD 2–18 years see *BNF for Children*

13.8 Sunscreens and camouflagers

13.8.1 Sunscreen preparations
13.8.2 Camouflagers

13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption, solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate *rosacea* and some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many

photosensitivity reactions and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations

rINN	INCI
amiloxate	isoamyl *p*-methoxycinnamate
avobenzone	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisoctrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (*or* ethylhexyl) methoxycinnamate
octocrilene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

Borderline substances The preparations marked 'ACBS' are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 7.

Delph® (Fenton)

Lotion, (UVA and UVB protection; UVB-SPF 30), octinoxate 4.8%, oxybenzone 1.5%, titanium dioxide 2%, net price 200 mL = £3.57. ACBS

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), imidurea

Note For INCI synonyms, see table above

Sunsense® Ultra (Crawford)

Lotion (UVA and UVB protection; UVB-SPF 50+), octinoxate 6%, enzacamene 4%, avobenzone 2%, oxybenzone 2%, ensulizole 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £4.11, 125 mL = £6.86, 500 mL = £15.54. ACBS

Excipients include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

Uvistat® (LPC)

Cream (UVA and UVB protection; UVB-SPF 30), avobenzone 5%, bisoctrizole 1.5%, octinoxate 7.5%, octrocrilene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

Cream (UVA and UVB protection; UVB-SPF 50), amiloxate 2%, avobenzone 5%, bisoctrizole 6%, octinoxate 10%, octrocrilene 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS

Excipients include disodium edetate, polysorbate 60, propylene glycol

Note For INCI synonyms, see table above

Lipscreen (UVA and UVB protection; UVB-SPF 50), avobenzone 5%, bemotrizinol 3%, octinoxate 10%, octocrilene 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS

Excipients include butylated hydroxytoluene, hydroxybenzoates (parabens)

Note For INCI synonyms, see table above

Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments are used for non-hypertrophic *actinic keratosis*. An **emollient** may be sufficient for mild lesions. **Diclofenac** gel is suitable for the treatment of superficial lesions in mild disease. **Fluorouracil** cream is effective against most types of non-hypertrophic actinic keratosis. **Imiquimod** (section 13.7) is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. **Photodynamic therapy** in combination with methyl-5-aminolevulinate cream (*Metvix®*, available from Galderma) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial *basal cell carcinomas*. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

DICLOFENAC SODIUM

Indications actinic keratosis

Cautions as for topical NSAIDs, see section 10.3.2

Contra-indications as for topical NSAIDs, see section 10.3.2

Side-effects as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

Dose

- Apply thinly twice daily for 60–90 days; max. 8 g daily

Solaraze® (Almirall) PoM

Gel, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60

Excipients include benzyl alcohol

FLUOROURACIL

Indications superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

Cautions avoid contact with mucous membranes; caution in handling—irritant to tissues

Pregnancy manufacturer advises avoid (teratogenic)

Breast-feeding manufacturer advises avoid

Side-effects local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

Dose

- Apply thinly to the affected area once or twice daily; max. area of skin treated at one time, 500 cm^2 (e.g. 23 cm × 23 cm); usual duration of initial therapy, 3–4 weeks

Note Alternative regimens may be in use in some settings

Efudix® (Meda) PoM

Cream, fluorouracil 5%, net price 40 g = £32.73

Excipients include hydroxybenzoates (parabens), polysorbate 60, propylene glycol, stearyl alcohol

13.8.2 Camouflagers

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Borderline substances The preparations marked 'ACBS' are regarded as drugs when prescribed for post-operative scars and other deformities and as an adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo. See also Appendix 7.

Covermark® (Skin Camouflage Co.)

Classic foundation (masking cream), net price 15 mL (10 shades) = £11.32. ACBS

Excipients include beeswax, hydroxybenzoates (parabens), fragrance

Finishing powder, net price 25 g = £11.32. ACBS

Excipients include beeswax, hydroxybenzoates (parabens), fragrance

Dermacolor® (Fox)

Camouflage creme, (100 shades), net price 25 mL = £9.96. ACBS

Excipients include beeswax, butylated hydroxytoluene, fragrance, propylene glycol, stearyl alcohol, wool fat

Fixing powder, (7 shades), net price 60 g = £8.45. ACBS

Excipients include fragrance

Keromask® (Lornamead)

Masking cream, (9 shades), net price 15 mL = £5.68. ACBS

Excipients include butylated hydroxyanisole, hydroxybenzoates (parabens), wool fat, propylene glycol

Finishing powder, net price 20 g = £5.68. ACBS

Excipients include butylated hydroxytoluene, hydroxybenzoates (parabens)

Veil® (Thomas Blake)

Cover cream, (40 shades), net price 19 g = £20.63, 44 g = £30.68, 70 g = £38.74. ACBS

Excipients include hydroxybenzoates (parabens), wool fat derivative

Finishing powder, translucent, net price 35 g = £22.62. ACBS

Excipients include butylated hydroxyanisole, hydroxybenzoates (parabens)

13.9 Shampoos and other preparations for scalp and hair conditions

Dandruff is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and **selenium sulphide** may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. **Ketoconazole** shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions (section 13.4) can also be used.

Shampoos containing **coal tar** and **salicylic acid** may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in *psoriasis* that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

See below for male-pattern baldness and also section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and section 13.10.2 (ringworm).

Shampoos

[1] **Ketoconazole** (Non-proprietary) PoM

Cream—section 13.10.2

Shampoo, ketoconazole 2%, net price 120 mL = £3.53

Excipients include imidurea

Brands include *Dandrazol® 2% Shampoo, Nizoral®*

Dose treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply once every 1–2 weeks); treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure); leave preparation on for 3–5 minutes before rinsing

1. Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days

Alphosyl 2 in 1® (GSK Consumer Healthcare)

Shampoo, alcoholic coal tar extract 5%, net price 125 mL = £1.81, 250 mL = £3.43

Excipients include hydroxybenzoates (parabens), fragrance

Dose dandruff, use once or twice weekly as necessary; psoriasis, seborrhoeic dermatitis, scaling and itching, use every 2–3 days

Capasal® (Dermal)

Shampoo, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69

Excipients none as listed in section 13.1.3

Dose scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap, apply daily as necessary

Ceanel Concentrate® (Ferndale)
Shampoo, cetrimide 10%, undecenoic acid 1%, phenylethyl alcohol 7.5%, net price 150 mL = £3.40, 500 mL = £9.80
Excipients none as listed in section 13.1.3
Dose scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 3 times in first week then twice weekly

Dermax® (Dermal)
Shampoo, benzalkonium chloride 0.5%, net price 250 mL = £5.69
Excipients none as listed in section 13.1.3
Dose seborrhoeic scalp conditions associated with dandruff and scaling, apply as necessary

Meted® (Alliance)
Shampoo, salicylic acid 3%, sulphur 5%, net price 120 mL = £3.80
Excipients include fragrance
Dose scaly scalp disorders including psoriasis, seborrhoeic dermatitis, and dandruff, apply at least twice weekly
Note May be difficult to obtain

Pentrax® (Alliance)
Shampoo, coal tar 4.3%, net price 120 mL = £3.80
Excipients none as listed in section 13.1.3
Dose scaly scalp disorders including psoriasis, seborrhoeic dermatitis, and dandruff, apply at least twice weekly
Note May be difficult to obtain

Psoriderm® (Dermal)
Scalp lotion (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74
Excipients include disodium edetate
Dose scalp psoriasis, use as necessary

Selsun® (Chattem UK)
Shampoo, selenium sulphide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75
Excipients include fragrance
Cautions avoid using 48 hours before or after applying hair colouring, straightening or waving preparations
Dose seborrhoeic dermatitis and dandruff, apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary; CHILD under 5 years not recommended; pityriasis versicolor, section 13.10.2 [unlicensed indication]

T/Gel® (J&J)
Shampoo, coal tar extract 2%, net price 125 mL = £3.18, 250 mL = £4.78
Excipients include fragrance, hydroxybenzoates (parabens), imidurea
Dose scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 2–3 times weekly

Other scalp preparations

Cocois®
Section 13.5.2

Etrivex®
Section 13.4

Polytar® (Stiefel)
Liquid, arachis (peanut) oil extract of coal tar 0.3%, cade oil 0.3%, coal tar solution 0.1%, oleyl alcohol 1%, tar 0.3%, net price 250 mL = £2.23
Excipients include fragrance, imidurea, polysorbate 80
Dose scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

Polytar Plus® (Stiefel)
Liquid, ingredients as *Polytar®* liquid with hydrolysed animal protein 3%, net price 500 mL = £3.91
Excipients include fragrance, imidurea, polysorbate 80
Dose scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine, an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women. Eflornithine should be discontinued in the absence of improvement after treatment for 4 months.

Co-cyprindiol (section 13.6.2) may be effective for moderately severe hirsutism. **Metformin** (section 6.1.2.2) is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

EFLORNITHINE

Indications see notes above
Pregnancy toxicity in *animal* studies—manufacturer advises avoid
Breast-feeding manufacturer advises avoid—no information available
Side-effects acne, application site reactions including burning and stinging sensation, rash; *less commonly* abnormal hair texture and growth
Dose
- Apply thinly twice daily; CHILD under 12 years not recommended
  Note Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after eflornithine; do not wash treated area for 4 hours after application

Vaniqa® (Almirall) PoM
Cream, eflornithine (as hydrochloride) 11.5%, net price 60 g = £52.08
Excipients include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol
Note The *Scottish Medicines Consortium* has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

Androgenetic alopecia

Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of **minoxidil** may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

FINASTERIDE

Indications androgenetic alopecia in men; benign prostatic hyperplasia (section 6.4.2)
Cautions section 6.4.2
Side-effects section 6.4.2
Dose
- By mouth 1 mg daily

Propecia® (MSD) PoM ₩
Tablets, f/c, beige, finasteride 1 mg, net price 28-tab pack = £26.99, 84-tab pack = £81.55

MINOXIDIL

Indications androgenetic alopecia (men and women)

Cautions section 2.5.1 (but only about 1–2% absorbed); avoid contact with eyes, mouth and mucous membranes, broken, infected, shaved, or inflamed skin; avoid inhalation of spray mist; avoid occlusive dressings and topical drugs which enhance absorption

Contra-indications section 2.5.1

Pregnancy section 2.5.1

Breast-feeding section 2.5.1

Side-effects section 2.5.1; also *less commonly* local irritation, changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks)

Dose

- Apply 1 mL twice daily to dry hair and scalp (discontinue if no improvement after 1 year)

Regaine® (McNeil) ⓐ

Regaine® for Women Regular Strength topical solution, minoxidil 2% in an aqueous alcoholic basis, net price 60-mL bottle with applicators = £14.16

Excipients include propylene glycol

Cautions flammable; wash hands after application

Regaine® for Men Extra Strength topical solution, minoxidil 5% in an aqueous alcoholic basis, net price 60-mL bottle with applicators = £17.00, 3 × 60-mL bottles = £34.03

Excipients include propylene glycol

Cautions flammable; wash hands after application

13.10 Anti-infective skin preparations

13.10.1 Antibacterial preparations
13.10.2 Antifungal preparations
13.10.3 Antiviral preparations
13.10.4 Parasiticidal preparations
13.10.5 Preparations for minor cuts and abrasions

13.10.1 Antibacterial preparations

13.10.1.1 Antibacterial preparations only used topically
13.10.1.2 Antibacterial preparations also used systemically

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of **fusidic acid**; **mupirocin** should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as **flucloxacillin** (or **clarithromycin** in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided** on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone–iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that retapamulin (*Altargo®*) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

Silver sulfadiazine is used in the treatment of infected burns.

13.10.1.1 Antibacterial preparations only used topically

MUPIROCIN

Indications bacterial skin infections (see also notes above)

Renal impairment manufacturer advises caution when *Bactroban®* ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding no information available

Side-effects local reactions including urticaria, pruritus, burning sensation, rash

Dose

- ADULT and CHILD over 1 year, apply up to 3 times daily for up to 10 days; CHILD under 1 year see *BNF for Children*

Bactroban® (GSK) PoM

Cream, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38
Excipients include benzyl alcohol, cetyl alcohol, stearyl alcohol

Ointment, mupirocin 2%, net price 15 g = £4.38
Excipients none as listed in section 13.1.3
Note may sting

Nasal ointment—section 12.2.3

NEOMYCIN SULPHATE

Indications bacterial skin infections

Cautions large areas, see below
Large areas If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

Contra-indications neonates

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Neomycin Cream BPC PoM

Cream, neomycin sulphate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17
Excipients include cetostearyl alcohol, edetic acid (EDTA)
Dose apply up to 3 times daily (short-term use)

POLYMYXINS

Indications bacterial skin infections

Cautions large areas, see below
Large areas If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

Renal impairment see Cautions above

Side-effects sensitisation (see also notes above)

Polyfax® (TEVA UK) PoM

Ointment, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62
Excipients none as listed in section 13.1.3
Dose apply twice daily or more frequently if required

RETAPAMULIN

Indications superficial bacterial skin infections (see also notes above)

Contra-indications contact with eyes and mucous membranes

Side-effects local reactions including irritation, erythema, pain, contact dermatitis, and pruritus

Dose

- ADULT over 18 years, apply thinly twice daily for 5 days; max. area of skin treated 100 cm^2 or lesion length 10 cm; CHILD 9 months–18 years, apply thinly twice daily for 5 days; max. area of skin treated 2% of body surface area
  Note Review treatment if no response within 2–3 days

Altargo® (GSK) ▼ PoM

Ointment, retapamulin 1%, net price 5 g = £7.89.
Label: 28
Excipients include butylated hydroxytoluene

SILVER SULFADIAZINE
(Silver sulphadiazine)

Indications prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

Cautions G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also **interactions**: Appendix 1 (sulfonamides)
Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days. Argyria may also occur if large areas of skin are treated (or if application is prolonged).

Contra-indications sensitivity to sulfonamides; not recommended for neonates

Hepatic impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Renal impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

Side-effects allergic reactions including burning, itching and rashes; argyria reported following prolonged use; leucopenia reported (monitor blood levels)

Flamazine® (S&N Hlth.) PoM

Cream, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27
Excipients include cetyl alcohol, polysorbates, propylene glycol
Dose burns, apply daily or more frequently if very exudative; leg ulcers or pressure sores, apply daily or on alternate days (not recommended if ulcer very exudative); finger-tip injuries, apply every 2–3 days; consult product literature for details
Note Apply with sterile applicator

13.10.1.2 Antibacterial preparations also used systemically

Sodium fusidate is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 734.

Metronidazole is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

Angular cheilitis An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see section 12.3.2.

FUSIDIC ACID

Indications staphylococcal skin infections; penicillin-resistant staphylococcal infections (section 5.1.7); staphylococcal eye infections (section 11.3.1)

Cautions see notes above; avoid contact with eyes

Side-effects rarely hypersensitivity reactions

Dose

- Apply 3–4 times daily

Fucidin® (LEO) PoM

Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.64

Excipients include butylated hydroxyanisole, cetyl alcohol

Ointment, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79

Excipients include cetyl alcohol, wool fat

Dental prescribing on NHS May be prescribed as Sodium Fusidate ointment

METRONIDAZOLE

Indications see preparations; rosacea (see also section 13.6); *Helicobacter pylori* eradication (section 1.3); anaerobic infections (section 5.1.11 and section 7.2.2); protozoal infections (section 5.4.2)

Cautions avoid exposure to strong sunlight or UV light

Side-effects skin irritation

Dose

- See preparations

Acea® (Ferndale) PoM

Gel, metronidazole 0.75%, net price 40 g = £9.95

Excipients include disodium edetate, hydroxybenzoates (parabens)

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8 weeks

Anabact® (CHS) PoM

Gel, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose malodorous fungating tumours and malodorous gravitational and decubitus ulcers, apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrogel® (Galderma) PoM

Gel, metronidazole 0.75%, net price 40 g = £6.86

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

Malodorous fungating tumours, apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrosa® (Linderma) PoM

Gel, metronidazole 0.75%, net price 40 g = £19.90

Excipients include propylene glycol

Dose acute exacerbation of rosacea, apply thinly twice daily for up to 8 weeks

Metrotop® (Mölnlycke) PoM

Gel, metronidazole 0.8%, net price 15 g = £4.59

Excipients none as listed in section 13.1.3

Dose malodorous fungating tumours and malodorous gravitational and decubitus ulcers, apply to clean wound 1–2 times daily and cover (flat wounds, apply liberally; cavities, smear on paraffin gauze and pack loosely)

Rosiced® (Fabre) PoM

Cream, metronidazole 0.75%, net price 30 g = £7.50

Excipients include propylene glycol

Dose inflammatory papules and pustules of rosacea, apply twice daily for 6 weeks (longer if necessary)

Rozex® (Galderma) PoM

Cream, metronidazole 0.75%, net price 40 g = £6.86

Excipients include benzyl alcohol, isopropyl palmitate

Gel, metronidazole 0.75%, net price 40 g = £6.86

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Dose inflammatory papules, pustules and erythema of rosacea, apply twice daily for 3–4 months

Zyomet® (Goldshield) PoM

Gel, metronidazole 0.75%, net price 30 g = £12.00

Excipients include benzyl alcohol, disodium edetate, propylene glycol

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

13.10.2 Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for nail or scalp infection or if the skin infection is widespread, disseminated, or intractable. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

Dermatophytoses Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete's foot), or nail (tinea unguium). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos, section 13.9). The imidazole antifungals **clotrimazole, econazole, ketoconazole**, and **miconazole** are all effective. **Terbinafine** cream is also effective but it is more expensive. Other topical antifungals include **griseofulvin** and the **undecenoates**. **Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of **amorolfine** or **tioconazole** may be useful for treating early onychomycosis when involvement is limited to mild distal disease in up to 2 nails, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

Pityriasis versicolor Pityriasis (tinea) versicolor can be treated with **ketoconazole** shampoo (section 13.9). Alternatively, **selenium sulphide** shampoo [unlicensed indication] (section 13.9) can be used as a lotion (diluting with water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals **clotrimazole**, **econazole**, **ketoconazole**, and **miconazole**, and topical **terbinafine** are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

Candidiasis Candidal skin infections can be treated with a topical imidazole antifungal, such as **clotrimazole**, **econazole**, **ketoconazole**, or **miconazole**; topical terbinafine is an alternative. Topical application of **nystatin** is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment (section 5.2) generally with a triazole such as fluconazole; systemic treatment with terbinafine is **not appropriate** for refractory candidiasis.

Angular cheilitis Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*. For further information on angular cheilitis, see p. 695.

Compound topical preparations Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

Cautions Contact with eyes and mucous membranes should be avoided.

Side-effects Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if these are severe.

AMOROLFINE

Indications fungal nail infections

Cautions see notes above; also avoid contact with ears

Pregnancy systemic absorption very low, but manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above

Dose

- Apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

Loceryl® (Galderma) (PoM)

Nail lacquer, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £18.17. Label: 10, patient information leaflet

Excipients none as listed in section 13.1.3

Note Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL

BENZOIC ACID

Indications ringworm (tinea), but see notes above

Benzoic Acid Ointment, Compound, BP (Whitfield's ointment)

Ointment, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

Excipients include cetostearyl alcohol

Dose apply twice daily

CLOTRIMAZOLE

Indications fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Dose

- Apply 2–3 times daily

Clotrimazole (Non-proprietary)

Cream, clotrimazole 1%, net price 20 g = £1.52

Canesten® (Bayer Consumer Care)

Cream, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Solution, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.43. For hairy areas

Excipients none as listed in section 13.1.3

Spray, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.99. Label: 15. For large or hairy areas

Excipients include propylene glycol

ECONAZOLE NITRATE

Indications fungal skin infections; vaginal candidiasis (section 7.2.2)

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Dose

- Skin infections apply twice daily; nail infections, apply once daily under occlusive dressing

Pevaryl® (Janssen-Cilag)

Cream, econazole nitrate 1%, net price 30 g = £2.65

Excipients include butylated hydroxyanisole, fragrance

GRISEOFULVIN

Indications tinea pedis; resistant fungal infections (section 5.2.5)

Cautions see notes above

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk

Side-effects see notes above

Dose

- Apply 400 micrograms (1 spray) to an area approx. 13 cm^2 once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks

Grisol AF® (Transdermal)

Spray, griseofulvin 400 micrograms/metered spray, net price 20-mL (400-dose) spray = £4.00. Label: 15

Excipients include benzyl alcohol

KETOCONAZOLE

Indications fungal skin infections; systemic or resistant fungal infections (section 5.2.2); vulval candidiasis (section 7.2.2)

Cautions see notes above; do **not** use within 2 weeks of a topical corticosteroid for seborrhoeic dermatitis—risk of skin sensitisation

Side-effects see notes above

Dose

- Tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily

Nizoral® (Janssen-Cilag) PoM

[1] Cream, ketoconazole 2%, net price 30 g = £3.40

Excipients include cetyl alcohol, polysorbates, propylene glycol, stearyl alcohol

Note A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo

Shampoo—section 13.9

1. NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'

MICONAZOLE NITRATE

Indications fungal skin infections; oral and intestinal fungal infections (section 12.3.2); vaginal candidiasis (section 7.2.2)

Cautions see notes above

Side-effects see notes above

Dose

- Apply twice daily continuing for 10 days after lesions have healed; nail infections, apply 1–2 times daily

Miconazole (Non-proprietary)

Cream, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97

Dental prescribing on NHS Miconazole cream may be prescribed

Daktarin® (Janssen-Cilag)

Cream, miconazole nitrate 2%, net price 30 g = £1.82

Excipients include butylated hydroxyanisole

Note A 15-g tube NHS is on sale to the public

Powder NHS, miconazole nitrate 2%, net price 20 g = £2.27

Excipients none as listed in section 13.1.3

Dual Action Spray powder, miconazole nitrate 0.16%, in an aerosol basis, net price 100 g = £2.27

Excipients none as listed in section 13.1.3

NYSTATIN

Indications skin infections due to *Candida* spp.; oral fungal infections (section 12.3.2)

Cautions see notes above

Side-effects see notes above

Nystaform® (Typharm) PoM

Cream, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Dose apply 2–3 times daily continuing for 7 days after lesions have healed.

SALICYLIC ACID

Indications fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); acne vulgaris (section 13.6.1); warts and calluses (section 13.7)

Cautions avoid broken or inflamed skin

Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin

Pregnancy avoid

Side-effects see notes above

Dose

- ADULT and CHILD over 5 years, apply twice daily and after washing

Phytex® (Wynlit)

Paint, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.81

Excipients none as listed in section 13.1.3

Note Flammable

TERBINAFINE

Indications fungal skin infections

Cautions avoid contact with eyes

Pregnancy manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects

Breast-feeding manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest

Side-effects see notes above

Dose

- Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; CHILD see *BNF for Children*

[1] **Terbinafine** (Non-proprietary) PoM

Cream, terbinafine hydrochloride 1%, net price 15 g = £5.10, 30 g = £2.69

1. Preparations of terbinafine hydrochloride (max. 1%) can be sold to the public for external use for the treatment of tinea pedis as a cutaneous solution in a pack containing max. 15 g, *or* for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, *or* for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 30 g gel

Lamisil® (Novartis Consumer Health) PoM

Cream, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

Excipients include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol

Tablets—section 5.2.5

TIOCONAZOLE

Indications fungal nail infections

Cautions see notes above

Pregnancy manufacturer advises avoid

Side-effects see notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation

Dose

- Apply to nails and surrounding skin twice daily usually for up to 6 months (may be extended to 12 months)

Trosyl® (Pfizer) PoM

Cutaneous solution, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

Excipients none as listed in section 13.1.3

UNDECENOATES

Indications see under preparations below

Side-effects see notes above

Dose

- See under preparations below

Mycota® (Thornton & Ross)

Cream, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.64

Excipients include fragrance

Dose treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

Powder, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.22

Excipients include fragrance

Dose treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

Spray application, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.46

Excipients include fragrance

Dose treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

13.10.3 Antiviral preparations

Aciclovir cream is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster (shingles)* (for details of systemic use see section 5.3.2.1).

Idoxuridine solution (5% in dimethyl sulfoxide) is of little value.

Herpes labialis **Aciclovir** cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream. These creams should not be used in the mouth.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth (see p. 392).

ACICLOVIR

(Acyclovir)

Indications see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

Cautions avoid contact with eyes and mucous membranes

Pregnancy not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

Side-effects transient stinging or burning; occasionally erythema, itching or drying of the skin

Dose

- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

[1]**Aciclovir** (Non-proprietary) PoM

Cream, aciclovir 5%, net price 2 g = £1.10, 10 g = £1.81

Excipients include propylene glycol

Brands include *Zuvogen®* (*excipients* also include cetyl alcohol, propylene glycol)

Dental prescribing on NHS Aciclovir Cream may be prescribed

1. A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

Zovirax® (GSK) PoM

Cream, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96

Excipients include cetostearyl alcohol, propylene glycol

Eye ointment—section 11.3.3

Tablets—section 5.3.2.1

PENCICLOVIR

Indications see notes above

Cautions avoid contact with eyes and mucous membranes

Side-effects transient stinging, burning, numbness; hypersensitivity reactions also reported

Vectavir® (Novartis Consumer Health) PoM

Cream, penciclovir 1%, net price 2 g = £4.20

Excipients include cetostearyl alcohol, propylene glycol

Dose herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack; CHILD under 12 years, not recommended

Dental prescribing on NHS May be prescribed as Penciclovir Cream

IDOXURIDINE IN DIMETHYL SULFOXIDE

Indications herpes simplex and herpes zoster infection but of little value

Cautions avoid contact with the eyes, mucous membranes, and textiles; **interactions:** Appendix 1 (dimethyl sulfoxide)

Contra-indications **not** to be used in mouth

Pregnancy teratogenic in *animal* studies—manufacturer advises avoid

Breast-feeding may make milk taste unpleasant

Side-effects stinging on application, changes in taste; overuse may cause maceration

Herpid® (Astellas) PoM

Application, idoxuridine 5% in dimethyl sulfoxide, net price 5 mL (with applicator) = £6.33

Dose apply to lesions 4 times daily for 4 days, starting at first sign of attack; CHILD under 12 years, not recommended

13.10.4 Parasiticidal preparations

Suitable quantities of parasiticidal preparations

	Skin creams	Lotions	Cream rinses
Scalp (head lice)	—	50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	—
Body (crab lice)	30–60 g	100 mL	—

These amounts are usually suitable for an adult for single application.

Scabies

Permethrin is used for the treatment of *scabies* (*Sarcoptes scabiei*); **malathion** can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin (available on a named patient basis from 'special-order' manufacturers or specialist importing companies, see p. 988) in a single dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone.

Application Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of **crotamiton** can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** (section 3.4.1) at night may also be useful.

Head lice

Dimeticone is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. **Malathion**, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

Wet combing methods Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process. Combing devices and topical solutions to aid the removal of head lice are available; some of these products are prescribable on the NHS, including *Bug Buster* kit, *Full Marks* solution, *Lyclear SprayAway*, *Nitcomb-M2*, *Nitcomb-S1*, *Nitlotion*, and *Nitty Gritty Nitfree*.

Crab lice

Permethrin and **malathion** are used to eliminate *crab lice* (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Benzyl benzoate

Benzyl benzoate is effective for *scabies* but is not a first-choice for *scabies* (see notes above).

BENZYL BENZOATE

Indications scabies (but see notes above)

Cautions children (not recommended, see also under Dose, below), avoid contact with eyes and mucous membranes; do not use on broken or secondarily infected skin

Breast-feeding suspend feeding until product has been washed off

Side-effects skin irritation, burning sensation especially on genitalia and excoriations, occasionally rashes

Dose

- Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

  Note Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears

Benzyl Benzoate Application, BP (Non-proprietary)

Application, benzyl benzoate 25% in an emulsion basis, net price 500 mL = £2.50

Dimeticone

Dimeticone coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

DIMETICONE

Indications head lice

Cautions avoid contact with eyes; children under 6 months, medical supervision required

Side-effects skin irritation

Dose

- Rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight); repeat application after 7 days

Hedrin® (Thornton & Ross)

Lotion, dimeticone 4%, net price 50 mL = £2.98, 120 mL spray pack = £7.13, 150 mL = £6.92

Note Patients should be told to keep hair away from fire and flames during treatment

Malathion

Malathion is recommended for *scabies*, *head lice* and *crab lice* (for details see notes above).

The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, applications of malathion liquid repeated at intervals of less than 1 week *or* application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

MALATHION

Indications see notes above and under preparations

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required

Side-effects skin irritation and hypersensitivity reactions; chemical burns also reported

Dose

- Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days
- Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days
- Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

  Note For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

Derbac-M® (SSL)

Liquid, malathion 0.5% in an aqueous basis, net price 50 mL = £2.37, 200 mL = £5.93

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

Permethrin

Permethrin is effective for *scabies* and *crab lice* (for details see notes above). Permethrin is active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

PERMETHRIN

Indications see notes above and under Dose

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required for cream rinse (head lice); children aged 2 months–2 years, medical supervision required for dermal cream (scabies)

Side-effects pruritus, erythema, and stinging; rarely rashes and oedema

Dose

- Scabies, apply 5% preparation over whole body and wash off after 8–12 hours; CHILD (see also Cautions, above) apply over whole body including face, neck, scalp and ears; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

  Note Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears

  Larger patients may require up to two 30-g packs for adequate treatment
- Crab lice, ADULT over 18 years, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight; repeat application after 7 days

Permethrin (Non-proprietary)

Cream, permethrin 5%, net price 30 g = £5.43

Lyclear® Creme Rinse (Chefaro UK)

Cream rinse, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £2.38, 2 × 59-mL pack = £4.32

Excipients include cetyl alcohol

Dose head lice, not recommended, therefore no dose stated (insufficient contact time)

Lyclear® Dermal Cream (Chefaro UK)

Dermal cream, permethrin 5%, net price 30 g = £5.71. Label: 10, patient information leaflet

Excipients include butylated hydroxytoluene, wool fat derivative

13.10.5 Preparations for minor cuts and abrasions

Some of the preparations listed are used in minor burns, and abrasions. They are applied as necessary but should not be used on large wounds or for prolonged periods because of the possibility of hypersensitivity. The effervescent effect of hydrogen peroxide (section 13.11.6) is used to clean minor cuts and abrasions. Preparations containing camphor and sulphonamides should be **avoided**. Preparations such as magnesium sulphate paste are also listed but are now rarely used to treat carbuncles and boils as these are best treated with antibiotics (section 5.1.1.2).

Cetrimide Cream, BP

Cream, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

Proflavine Cream, BPC

Cream, proflavine hemisulphate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £1.59

Excipients include beeswax, wool fat

Note Stains clothing

Preparations for boils

Magnesium Sulphate Paste, BP

Paste, dried magnesium sulphate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 75p, 50 g = 87p

Note Should be stirred before use

Dose apply under dressing

Collodion

Flexible collodion may be used to seal minor cuts and wounds that have partially healed.

Collodion, Flexible, BP

Collodion, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 38p. Label: 15

Contra-indications allergy to colophony in elastic adhesive plasters and tape

Skin tissue adhesive

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

Dermabond ProPen® (Ethicon)

Topical Skin Adhesive, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.38

Epiglu® (Schuco)

Tissue adhesive, sterile, ethyl-2-cyanoacrylate 954.5 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £149.50 (with dispensing pipettes and pallete)

Histoacryl® (Braun)

Tissue adhesive, sterile, enbucrilate, net price 5 × 200-mg unit (blue) = £32.00, 10 × 200-mg unit (blue) = £67.20, 5 × 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

LiquiBand® (MedLogic)

Tissue adhesive, sterile, enbucrilate, net price 0.5-g amp = £5.50

13.11 Skin cleansers, antiseptics, and preparations for promotion of wound healing

13.11.1 Alcohols and saline
13.11.2 Chlorhexidine salts
13.11.3 Cationic surfactants and soaps
13.11.4 Iodine
13.11.5 Phenolics
13.11.6 Oxidisers and dyes
13.11.7 Preparations for promotion of wound healing

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment (section 13.2.1) that do not irritate the skin are best used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing **chlorhexidine** or **povidone–iodine**, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as **chlorhexidine** or **povidone–iodine** are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing **cetrimide** can be used if a detergent effect is also required.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10 000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry. It can stain skin and nails especially with prolonged use.

13.11.1 Alcohols and saline

ALCOHOL

Indications skin preparation before injection

Cautions flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

Industrial Methylated Spirit, BP

Solution, 19 volumes of ethanol and 1 volume approved wood naphtha, net price '66 OP' (containing 95% by volume alcohol) 100 mL = 40p; '74 OP' (containing 99% by volume alcohol) 100 mL = 39p. Label: 15

Surgical Spirit, BP
Spirit, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

SODIUM CHLORIDE

Indications see notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4)

Sodium Chloride (Non-proprietary)
Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL unit = £5.50, 200-mL can = £2.65, 1 litre = 97p

Flowfusor® (Fresenius Kabi)
Solution (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53

Irriclens® (ConvaTec)
Solution in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.30

Irripod® (C D Medical)
Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.50

Miniversol® (Aguettant)
Solution (sterile), sodium chloride 0.9%, net price 30 × 45-mL unit = £13.20; 30 × 100-mL unit = £19.50

Normasol® (Mölnlycke)
Solution (sterile), sodium chloride 0.9%, net price 25 × 25-mL sachet = £6.14; 10 × 100-mL sachet = £7.47

Stericlens® (C D Medical)
Solution in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £1.94, 240-mL can = £2.95

Steripod® Sodium Chloride (Medlock)
Solution (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £7.57

13.11.2 Chlorhexidine salts

CHLORHEXIDINE

Indications see under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4)
Cautions avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy
Side-effects occasional sensitivity

Chlorhexidine 0.05% (Baxter)
2000 Solution (sterile), pink, chlorhexidine acetate 0.05%, net price 500 mL = 72p, 1000 mL = 77p
For cleansing and disinfecting wounds and burns

Cepton® (LPC)
Skin wash (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £2.48
For use as skin wash in acne

Lotion, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48
For skin disinfection in acne

ChloraPrep® (Enturia)
Cutaneous solution, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (single applicator) 0.67 mL = 30p, 1.5 mL = 55p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.50; (single applicator, with tint) 3 mL = 90p, 10.5 mL = £3.07, 26 mL = £6.83
For skin disinfection before invasive procedures; CHILD under 2 months, not recommended
Note Flammable

CX Antiseptic Dusting Powder® (Ecolab)
Dusting powder, sterile, chlorhexidine acetate 1%, net price 15 g = £3.40
For skin disinfection

Hibiscrub® (Mölnlycke)
Cleansing solution, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £24.00
Excipients include fragrance
Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

Hibi® Liquid Hand Rub+ (Mölnlycke)
Solution, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70%, net price 500 mL = £5.25
To be used undiluted for hand and skin disinfection

Hibitane Obstetric® (Derma UK)
Cream, chlorhexidine gluconate solution 5% (≡ 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £4.44
For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

Hydrex® (Ecolab)
Solution, chlorhexidine gluconate solution 2.5% (≡ chlorhexidine gluconate 0.5%), in an alcoholic solution, net price 600 mL (clear) = £2.72; 600 mL (pink) = £2.72, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26
For pre-operative skin disinfection
Note Flammable

Surgical scrub, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £2.44, 500 mL = £2.58
For pre-operative hand and skin preparation and for general hand disinfection

Unisept® (Medlock)
Solution (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 × 25-mL sachet = £5.40; 10 × 100-mL sachet = £6.67
For cleansing and disinfecting wounds and burns and swabbing in obstetrics

With cetrimide

Tisept® (Medlock)
Solution (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 × 25-mL sachet = £5.20; 10 × 100-mL sachet = £6.68
To be used undiluted for general skin disinfection and wound cleansing

Travasept 100® (Baxter)
Solution (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p
To be used undiluted in skin disinfection such as wound cleansing and obstetrics

13.11.3 Cationic surfactants and soaps

CETRIMIDE

Indications skin disinfection

Cautions avoid contact with eyes; avoid use in body cavities

Side-effects skin irritation and occasionally sensitisation

Preparations

Ingredient of *Tisept®* and *Travasept® 100*, see above

13.11.4 Iodine

POVIDONE–IODINE

Indications skin disinfection

Cautions broken skin (see below)

Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

Contra-indications preterm neonate gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

Renal impairment avoid regular application to inflamed or broken mucosa

Pregnancy sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester

Breast-feeding avoid

Side-effects rarely sensitivity; may interfere with thyroid function tests

Betadine® (Mölnlycke)

Dry powder spray, povidone–iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63

For skin disinfection, particularly minor wounds and infections; CHILD under 2 years not recommended

Note Not for use in serous cavities

Savlon® Dry (Novartis Consumer Health)

Powder spray, povidone–iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.39

For minor wounds

Videne® (Ecolab)

Alcoholic tincture, povidone–iodine 10%, net price 500 mL = £3.46

To be applied undiluted in pre-operative skin disinfection

Antiseptic solution, povidone–iodine 10% in aqueous solution, net price 500 mL = £3.46

To be applied undiluted in pre-operative skin disinfection and general antisepsis

Surgical scrub, povidone–iodine 7.5% in aqueous solution, net price 500 mL = £3.46

To be used as a pre-operative scrub for hand and skin disinfection

13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

13.11.6 Oxidisers and dyes

HYDROGEN PEROXIDE

Indications see under preparations below

Cautions large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

Hydrogen Peroxide Solution, BP

Solution 6% (20 vols), net price 200 mL = 45p

Solution 3% (10 vols), net price 200 mL = 44p

For skin disinfection, particularly cleansing and deodorising wounds and ulcers

Note The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

Important Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

Crystacide® (GP Pharma)

Cream, hydrogen peroxide 1%, net price 10 g = £4.82, 25 g = £8.07, 40 g = £11.62

Dose superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks

Excipients include edetic acid (EDTA), propylene glycol

POTASSIUM PERMANGANATE

Indications cleansing and deodorising suppurating eczematous reactions and wounds

Cautions irritant to mucous membranes

Dose

- Wet dressings or baths, approx. 0.01% solution

Note Stains skin and clothing

Potassium Permanganate Solution

Solution, potassium permanganate 0.1% (1 in 1000) in water

Dose to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

Permitabs® (Alliance)

Solution tablets, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £9.85

Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

13.11.7 Preparations for promotion of wound healing

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings (Appendix 8) are effective at wound debridement. Sterile larvae (maggots) (*LarvE®*, Zoobiotic) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superim-

posed contact sensitivity to substances such as neomycin or lanolin.

For further information on wound management products see Appendix 8, p. 935.

Growth factor

A topical preparation of **becaplermin** (recombinant human platelet-derived growth factor) is licensed as an adjunct treatment of full-thickness, neuropathic, diabetic ulcers. It enhances the formation of granulation tissue, thereby promoting wound healing.

BECAPLERMIN

(Recombinant human platelet-derived growth factor)

Indications see notes above

Cautions avoid on sites with infection, or peripheral arteriopathy

Contra-indications malignant disease

Side-effects pain; infections including cellulitis and osteomyelitis; local reactions including erythema; *rarely* bullous eruption, oedema, and hypertrophic granulation

Dose

- Full-thickness, neuropathic, diabetic ulcers (no larger than 5 cm^2), apply thin layer daily and cover with gauze dressing moistened with physiological saline; max. duration of treatment 20 weeks (reassess if no healing after first 10 weeks); CHILD under 18 years see *BNF for Children*

Regranex® (Janssen-Cilag) PoM

Gel, becaplermin (recombinant human platelet-derived growth factor) 0.01%, net price 15 g = £240.92

Excipients include hydroxybenzoates (parabens)

13.12 Antiperspirants

Aluminium chloride is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use **glycopyrronium bromide** as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. *Botox®* contains **botulinum toxin type A complex** and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment (section 4.9.3).

ALUMINIUM SALTS

Indications see under Dose below

Cautions avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

Side-effects skin irritation

Dose

- Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use
- Hyperhidrosis, bromidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin

Anhydrol® Forte (Dermal)

Solution (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15

Excipients none as listed in section 13.1.3

[1] **Driclor®** (Stiefel)

Application, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15

Excipients none as listed in section 13.1.3

1. A 30-mL pack is on sale to the public

ZeaSORB® (Stiefel)

Dusting powder, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61

Excipients include fragrance

GLYCOPYRRONIUM BROMIDE

Indications iontophoretic treatment of hyperhidrosis; other indications section 15.1.3

Cautions see section 15.1.3 (but poorly absorbed and systemic effects unlikely)

Contra-indications see section 15.1.3 (but poorly absorbed and systemic effects unlikely), infections affecting the treatment site

Side-effects see section 15.1.3 (but poorly absorbed and systemic effects unlikely), tingling at administration site

Dose

- Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

Robinul® (Goldshield) PoM

Powder, glycopyrronium bromide, net price 3 g = £175.00

13.13 Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubefacients are described in section 10.3.2.

Hirudoid® (Genus)

Cream, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Gel, heparinoid 0.3%, net price 50 g = £3.99

Excipients include propylene glycol, fragrance

Dose apply up to 4 times daily in superficial soft-tissue injuries and superficial thrombophlebitis

14 Immunological products and vaccines

14.1 Active immunity 746
14.2 Passive immunity 749
14.3 Storage and use 749
14.4 Vaccines and antisera 749
14.5 Immunoglobulins 769
14.5.1 Normal immunoglobulin 769
14.5.2 Disease-specific immunoglobulins 771
14.5.3 Anti-D (Rh_0) immunoglobulin 772
14.6 International travel 773

14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a *live attenuated* form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. *inactivated* preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. *detoxified exotoxins* produced by a micro-organism (e.g. tetanus vaccine), or
4. *extracts of* a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).
Chapters from the handbook are available at www.dh.gov.uk/immunisation
The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Cautions Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 750). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For **interactions** see Appendix 1 (vaccines).

See also Cautions under individual vaccines

Contra-indications Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

Gelatin	Neomycin	Streptomycin
Gentamicin	Penicillins	Thiomersal
Kanamycin	Polymyxin B	

Hypersensitivity to egg with evidence of previous anaphylactic reaction, contra-indicates influenza vaccine (prepared in hens' eggs), tick-borne encephalitis vaccine, and yellow fever vaccine. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:

- immunosuppressed (see Impaired immune response, below);
- pregnant (see Pregnancy and breast-feeding, below).

See also Contra-indications under individual vaccines.

Impaired immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: **adults**, at

least 40 mg daily for more than 1 week; **children**, 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs[1], and those being treated for malignant conditions with chemotherapy or generalised radiotherapy[1,2]. For special reference to *HIV infection*, see below.

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child (2002)* (available at www.rcpch.ac.uk).

Pregnancy Live vaccines should not be administered routinely to *pregnant women* because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease (e.g. to yellow fever), the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during pregnancy, see under individual vaccines.

Breast-feeding Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during breast-feeding, see under individual vaccines.

Side-effects Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthenia, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitivity reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

Oral vaccines such as cholera, live poliomyelitis, rotavirus, and live typhoid can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

See also Predisposition to neurological problems, below.

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see Adverse Reactions to Drugs, p. 12).

See also Preterm Birth, p. 748.

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 769) and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 772).

Post-immunisation pyrexia in infants

The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 6 hours later; ibuprofen may be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor's advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

Predisposition to neurological problems

When there is a personal or family history of *febrile* convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation pyrexia in infants, above) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and perinatal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be *deferred* and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

Vaccines and HIV infection HIV-positive individuals with or without symptoms can receive the following live vaccines:

MMR (but avoid if immunity significantly impaired), varicella-zoster (but avoid if immunity significantly impaired—consult product literature);[2,3]

and the following inactivated vaccines:

anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papilloma virus, influenza, meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should **not** receive:

BCG, typhoid (oral), yellow fever[4]

Note The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by *British HIV Association* (BHIVA) are available at www.bhiva.org and, *Immunisation of HIV-infected Children* issued by *Children's HIV Association* (CHIVA) are available at www.chiva.org.uk

3. The Royal College of Paediatrics and Child Health recommends that MMR is not given to a child with HIV infection whilst severely immunosuppressed.
4. If yellow fever risk is unavoidable, specialist advice should be sought.

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or **direct from Movianto**—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* (type b), meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for premature infants—see note above)	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	• **BCG Vaccine** See section 14.4, BCG Vaccines • **Hepatitis B Vaccine** See section 14.4, Hepatitis B Vaccine
2 months	• **Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)** First dose • **Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)** First dose
3 months	• **Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)** Second dose • **Meningococcal Group C Conjugate Vaccine** First dose
4 months	• **Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)** Third dose • **Meningococcal Group C Conjugate Vaccine** Second dose • **Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)** Second dose
12–13 months	• **Measles, Mumps and Rubella Vaccine, Live (MMR)** First dose • **Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)** Single booster dose • **Haemophilus Type b Conjugate Vaccine and Meningococcal Group C Conjugate Vaccine** Single booster dose
Between 3 years and 4 months, and 5 years	• **Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine** *or* **Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine** Single booster dose **Note:** Preferably allow interval of at least 3 years after completing primary course • **Measles, Mumps and Rubella Vaccine, Live (MMR)** Second dose
12–13 years (females only)	• **Human Papilloma Virus Vaccine** 3 doses; second dose 1–2 months, and third dose 6 months after first dose[1]
13–18 years	• **Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine** Single booster dose
During adult life, women of child-bearing age susceptible to rubella	• **Measles, Mumps and Rubella Vaccine, Live (MMR)** Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine
During adult life, if not previously immunised	• **Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine** 3 doses at intervals of 1 month Booster dose at least 1 year after primary course and again 5–10 years later

1. The two human papilloma virus vaccines are not interchangeable and one vaccine product should be used for the entire course; however for individuals with previous incomplete vaccination with *Gardasil*® who are eligible for HPV vaccination under the national programme, *Cervarix*® can be used to complete the vaccination course if necessary; the individual must be informed that *Cervarix*® does not protect against genital warts.

Vaccines and asplenia The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 330.

Route of administration Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route; some vaccines are given by others routes—the intradermal route for BCG vaccine, deep subcutaneous route for Japanese encephalitis, and varicella vaccine, and the oral route for cholera, live poliomyelitis, rotavirus, and live typhoid vaccines. The intramuscular route should not be used in patients with **bleeding disorders** such as haemophilia or thrombocytopenia. Vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

Note The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

High-risk groups

For information on high-risk groups, see section 14.4 under individual vaccines

BCG Vaccines

Hepatitis A Vaccine

Hepatitis B Vaccine

Influenza Vaccine

Pneumococcal Vaccines

Tetanus Vaccines

14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antiserum* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multi-dose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

14.4 Vaccines and antisera

Availability Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 41.

Enquiries for vaccines not available commercially can also be made to:

Immunisation Policy, Monitoring and Surveillance
Department of Health
Wellington House
133–155 Waterloo Road
London, SE1 8UG
vaccine.supply@dh.gsi.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979

and in Northern Ireland:

Pharmacy and Medicines Management Centre
Beech House
Antrim Hospital Site
Northern Health and Social Care Trust
Bush Road
Antrim, BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *Bacillus anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from the Centre for Infections, Health Protection Agency (tel. 020 8200 4400).

ANTHRAX VACCINE

Indications pre-exposure immunisation against anthrax; post-exposure immunisation (see notes above)

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1

Dose

- By intramuscular injection in deltoid region, initial course 3 doses of 0.5 mL at intervals of 3 weeks followed by a fourth dose after an interval of 6 months; booster, 0.5 mL every 12 months

Anthrax Vaccine (PoM)

Injection, suspension of anthrax antigens (not less than 0.125 mL/0.5 mL dose), sterile filtrate, adsorbed on to aluminium potassium sulphate

Excipients include thiomersal

Available from the Health Protection Agency's Centre for Emergency Preparedness and Response (Porton Down)

BCG vaccines

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should **not** be excluded.

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic Agents, below). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- all neonates and infants (0–12 months) born in areas where the incidence[1] of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence[1] of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence[1] of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence[1] of tuberculosis greater than 500 per 100 000
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years[2] at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence[1] of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

Bladder instillations of BCG are licensed for the management of bladder carcinoma (section 8.2.4).

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

BACILLUS CALMETTE-GUÉRIN VACCINE

BCG Vaccine

Indications immunisation against tuberculosis

Cautions see section 14.1; **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; *also* neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for patients with eczema, lesion-free site should be used)

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1 and notes above; *also* at the injection site, subcutaneous abscess, prolonged ulceration; *rarely* disseminated complications such as osteitis or osteomyelitis

Dose

- By intradermal injection ADULT and CHILD over 1 year, 0.1 mL; NEONATE and CHILD under 1 year, 0.05 mL

Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk

2. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients

showing tips of hair follicles is sign of correct injection; 7 mm bleb ≡ 0.1 mL injection, 3 mm bleb ≡ 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**.

Intradermal

Bacillus Calmette-Guérin Vaccine PoM

BCG Vaccine, Dried/Tub/BCG

Injection (powder for suspension), freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin.

Available from health organisations or direct from Movianto (SSI brand, multidose vial with diluent)

Diagnostic agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Note Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuanitFERON® TB Gold* and *T-SPOT®.TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.hpa.org.uk.

Tuberculin Purified Protein Derivative (Tuberculin PPD) PoM

Injection, heat-treated products of growth and lysis of appropriate *Mycobacterium* spp. 20 units/mL (2 units/0.1-mL dose) (for routine use), 1.5-mL vial; 100 units/ mL (10 units/0.1-mL dose), 1.5-mL vial

Dose by intradermal injection, for Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength)

Available from Movianto (SSI brand)

Note The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

Botulism antitoxin

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

Botulism Antitoxin PoM

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

Note The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

Dose prophylaxis, consult product literature

Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the duty doctor at the Health Protection Agency (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

Cholera vaccine

Cholera vaccine (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

CHOLERA VACCINE

Indications see notes above

Cautions see section 14.1 and notes above

Contra-indications see section 14.1; also acute gastro-intestinal illness

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also *rarely* respiratory symptoms such as rhinitis and cough; *very rarely* sore throat, insomnia

Dose

- ADULT and CHILD over 6 years 2 doses separated by an interval of 1–6 weeks; CHILD 2–6 years 3 doses each separated by an interval of 1–6 weeks

  Note If more than 6 weeks have elapsed between doses, the primary course should be restarted

- A single booster dose can be given 2 years after primary course for adults and children over 6 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

  Counselling Dissolve effervescent sodium bicarbonate granules in a glassful of water (approximately 150 mL). For adults and children over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination

Dukoral® (Crucell) PoM

Oral suspension, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

Diphtheria vaccines

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation *of children aged between 2 months and 10 years* vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of **diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed)** (see Immunisation schedule, section 14.1). In unimmunised individuals aged *over 10 years* the primary course comprises of 3 doses of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children *under 10 years* should receive *either* **adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine** *or* **adsorbed diphtheria** [low dose], **tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged *over 10 years* should receive **adsorbed diphtheria** [low dose], **tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Travel Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** should be administered.

Contacts Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.

DIPHTHERIA-CONTAINING VACCINES

Indications see notes above

Cautions see section 14.1 and see also individual components of vaccines

Contra-indications see section 14.1 and see also individual components of vaccines

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also restlessness, sleep disturbances, and unusual crying in infants

Dose

- See under preparations

Diphtheria-containing vaccines for children under 10 years

Important **Not** recommended for persons *aged 10 years or over* (see Diphtheria-containing Vaccines for Children over 10 years and Adults, p. 753)

Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed) PoM

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and *Haemophilus influenzae* type b (conjugated to tetanus protein), net price 0.5-mL vial = £19.94

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, CHILD 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above

Brands include *Pediacel®*; available as part of childhood immunisation schedule, from health organisations or Movianto

Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine PoM

Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56

Excipients may include neomycin and polymyxin B

Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; *see also* notes on booster doses, above

Brands include *Infanrix-IPV®*; available as part of childhood immunisation schedule, from health organisations or Movianto

Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine PoM

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £11.98

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; *see also* notes on booster doses, above

Brands include *Repevax®*; available as part of childhood immunisation schedule, from health organisations or Movianto

Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children *over 10 years*, for both primary immunisation and booster doses.

Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine PoM

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £6.35

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, ADULT and CHILD over 10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses and contacts, above

Brands include *Revaxis®*; available as part of immunisation schedule, from health organisations or Movianto

Diphtheria antitoxin

Diphtheria antitoxin is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

Diphtheria Antitoxin PoM

Dip/Ser

Dose prophylaxis, not recommended therefore no dose stated (see notes above)

Treatment, consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241)

Haemophilus type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjuate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

For use of Rifampicin in the prevention of secondary cases of *Haemophilus influenzae type b* disease, see Table 2, section 5.1.

Asplenia or splenic dysfunction Haemophilus influenzae type b vaccine is recommended for patients with asplenia or splenic dysfunction. Immunised adults and children over 1 year, who develop splenic dysfunction, should be given 1 additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). For elective splenectomy, the vaccine should ideally be given at least 2 weeks before surgery. Adults and children over 1 year, who are not immunised against haemophilus influenzae type b, should be given 2 doses of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) with an interval of 2 months between doses. However, children under 10 years, who are not immunised against diphtheria, tetanus, pertussis, poliomyelitis, and haemophilus influenzae type b should be given 3 doses (with an interval of 1 month between doses) of combined diphtheria, tetanus, pertussis (acellular component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine.

Complement deficiency Individuals who have been fully immunised with haemophilus influenzae type b vaccine, and who subsequently become complement deficient, may require further doses of haemophilus influenzae type b vaccine if they have insufficient antibody levels.

HAEMOPHILUS TYPE B CONJUGATE VACCINE

Indications see notes above

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also atopic dermatitis and hypotonia

Dose

- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

Menitorix® (GSK) PoM

Injection, powder for reconstitution, capsular polysaccharide of *Haemophilus influenzae* type b and capsular polysaccharide of *Neisseria meningitidis* group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £39.87

Dose by intramuscular injection, CHILD 1–10 years, 0.5 mL ADULT and CHILD over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from Movianto

Combined vaccines

See also under Diphtheria-containing Vaccines

Hepatitis A vaccine

Hepatitis A vaccine is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 774);
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine *Ambirix®* can also be used.

Intramuscular **normal immunoglobulin** (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

HEPATITIS A VACCINE

Indications immunisation against hepatitis A infection

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; for combination vaccines, see also Typhoid vaccine, p. 767

Dose

- See under preparations

Single component

Avaxim® (Sanofi Pasteur) PoM

Injection, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Avaxim®*. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

Epaxal® (Crucell) PoM

Injection, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81

Dose by intramuscular injection (see note below), ADULT and CHILD over 1 year, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if splenectomised)

Note Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Important *Epaxal®* contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contra-indicated in those hypersensitive to eggs or chicken protein.

Havrix Monodose® (GSK) PoM

Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (*Havrix Junior Monodose®*) = £16.77

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 1 mL as a single dose; booster dose, 1 mL 6–12 months after initial dose; CHILD 1–15 years 0.5 mL; booster dose, 0.5 mL 6–12 months after initial dose

Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Havrix Monodose®*. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Vaqta® Paediatric (Sanofi Pasteur) PoM

Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium

hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £14.74

Excipients include neomycin

Dose by intramuscular injection (see note below) CHILD 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose; under 1 year, not recommended

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

With hepatitis B vaccine

Ambirix® (GSK) ▼ PoM

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe = £31.18

Excipients include neomycin

Dose CHILD 1–15 years, by intramuscular injection (see note below); primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

Note Primary course should be completed with *Ambirix®* (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Important *Ambirix®* is **not** recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

Twinrix® (GSK) PoM

Injection, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (*Twinrix® Adult*) = £27.76, 0.5-mL prefilled syringe (*Twinrix® Paediatric*) = £20.79

Excipients include neomycin

Dose by intramuscular injection (see note below); ADULT and CHILD over 16 years, primary course of 3 doses of 1 mL (*Twinrix® Adult*), the second 1 month and the third 6 months after the first dose; CHILD 1–15 years, 3 doses of 0.5 mL (*Twinrix® Paediatric*) Accelerated schedule (e.g. for travellers departing within 1 month), ADULT, second dose 7 days after first dose, third dose after further 14 days and a fourth dose 12 months after the first dose

Note Primary course should be completed with *Twinrix®* (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced).

Important *Twinrix®* **not** recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus.

With typhoid vaccine

Hepatyrix® (GSK) PoM

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 15 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 767

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

ViATIM® (Sanofi Pasteur) PoM

Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 160 antigen units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £29.80

Excipients include neomycin

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 767

Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

Hepatitis B vaccine

Hepatitis B vaccine contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy *or* are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* (see p. 771) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients' tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 774);

- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease* see p. 746.

Specific **hepatitis B immunoglobulin** ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

HEPATITIS B VACCINE

Indications immunisation against hepatitis B infection
Cautions see section 14.1
Contra-indications see section 14.1
Pregnancy see p. 747
Breast-feeding see p. 747
Side-effects see section 14.1
Dose

- See under preparations

Single component

Engerix B® (GSK) PoM

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) prefilled syringe = £9.67, 1-mL vial = £12.34, 1-mL prefilled syringe = £12.99

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose; NEONATE (except if born to hepatitis B surface antigen positive mother, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; *exceptionally* (e.g. for travellers departing within 1 month), ADULT over 18 years, second dose 7 days after first dose, third dose 21 days after first dose, and fourth dose 12 months after first dose

Alternative schedule for CHILD 11–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), ADULT and CHILD over 16 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration; NEONATE (except if born to hepatitis B surface antigen positive mother, see above) and CHILD 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose *or* accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

Fendrix® (GSK) PoM

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

Excipients include traces of thiomersal

Dose ADULT and CHILD over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBvaxPRO® (Sanofi Pasteur) PoM

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL (5-microgram) prefilled syringe = £8.95, 1-mL (10-microgram) prefilled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose; CHILD under 16 years, 3 doses of 5 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

Chronic haemodialysis patients, by intramuscular injection (see note below) 3 doses of 40 micrograms, the second 1 month and the third 6 months after the first dose; booster doses may be required in those with low antibody concentration

Note Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttock (vaccine efficacy reduced)

With hepatitis A vaccine

See Hepatitis A Vaccine

Human papilloma virus vaccines

Human papilloma virus vaccine is available as a bivalent vaccine (*Cervarix*®) or a quadrivalent vaccine (*Gardasil*®). *Cervarix*® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papilloma virus types 16 and 18. *Gardasil*® is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papilloma virus types 6, 11, 16, and 18. The two vaccines are not interchangeable and one vaccine product should be used for an entire course. However, the Department of Health (November 2008) states that for individuals with previous incomplete vaccination with *Gardasil*®, who are eligible for HPV vaccination under the national programme, *Cervarix*® can be used to complete the vaccination course if necessary; the individual must be informed that *Cervarix*® does not protect against genital warts.

Human papilloma virus vaccine will be most effective if given before sexual activity starts. The first dose is given to females aged 12 to 13 years, the second and third doses are given 1–2 and 6 months after the first dose (see Immunisation schedule, section 14.1); all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses. Where there are significant challenges in scheduling vaccinations, or a high likelihood that the third dose will not be given, the third dose of *Cervarix*® can be given 3 months after the second dose. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papilloma virus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papilloma virus, routine cervical screening should continue.

HUMAN PAPILLOMA VIRUS VACCINES

Indications see notes above and under preparations

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy not known to be harmful, but vaccination should be postponed until completion of pregnancy

Breast-feeding see p. 747

Side-effects see section 14.1

Dose

- See notes above and under preparations

  Note To avoid confusion, prescribers should specify the brand to be dispensed

Cervarix® (GSK) PoM

Injection, suspension of virus-like particles of human papilloma virus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £80.50

Dose prevention of premalignant genital lesions and cervical cancer, by intramuscular injection into deltoid region, ADULT and CHILD 10–25 years, 3 doses of 0.5 mL, the second 1 month and the third 6 months after the first dose

Alternative schedule for ADULT and CHILD 10–25 years, 3 doses of 0.5 mL, the second 1–2.5 months, and the third 5–12 months after the first dose

Gardasil® (Sanofi Pasteur) ▼ PoM

Injection, suspension of virus-like particles of human papilloma virus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £86.50

Dose prevention of premalignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region or higher anterolateral thigh, ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second 2 months and the third 6 months after the first dose

Alternative schedule for ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second at least 1 month, and the third at least 4 months after the first dose; schedule should be completed within 12 months

Influenza vaccines

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Seasonal influenza vaccines Seasonal influenza vaccines will not control epidemics—immunisation is recommended *only for persons at high risk*. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including chemotherapy and prolonged corticosteroid treatment);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

For people who work in close contact with poultry on a regular basis, influenza immunisation is recommended as a precautionary public health measure. Seasonal human influenza vaccine does not protect against avian influenza, but it reduces the risk of poultry workers contracting both human and avian influenza simultaneously, and therefore also reduces the risk of a new influenza virus emerging.

A single dose of *Pandemrix*® can be used instead of the seasonal influenza vaccine if supplies of seasonal influenza vaccine are exhausted and cannot be replenished rapidly.

Monovalent influenza A(H1N1)v vaccines

Pandemrix® and *Celvapan*® are monovalent vaccines licensed against the influenza A(H1N1)v (swine flu) strain.

Pandemrix® is recommended for children aged 6 months–5 years who have not received the monovalent vaccine previously and who are in the risk groups prioritised for seasonal influenza vaccine. *Pandemrix*® is also recommended for all immunocompromised patients over 6 months of age who have not received the monovalent vaccine previously. Seasonal influenza vaccine should continue to be offered as normal. *Pandemrix*® can be given at the same time as the first dose of seasonal influenza vaccine; however, *Pandemrix*® should be given 4 weeks before the seasonal influenza vaccine to immunocompromised patients who only require one dose of seasonal influenza vaccine.

Further information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

INFLUENZA VACCINES

Indications annual immunisation against seasonal influenza; immunisation against influenza during a pandemic

Cautions see section 14.1; **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; avoid *Enzira*® or preparations marketed by Pfizer, Wyeth or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

Pregnancy not known to be harmful

Breast-feeding not known to be harmful

Side-effects see section 14.1; also reported febrile convulsions and transient thrombocytopenia

Dose

- Seasonal influenza, by intramuscular injection, ADULT and CHILD over 13 years, 0.5 mL as a single dose; CHILD 6 months–3 years, 0.25–0.5 mL; 3–13 years 0.5 mL; for children 6 months to 13 years who have not received seasonal influenza vaccine previously, repeat after 4–6 weeks

  By intradermal injection, see under *Intanza*® below

- Influenza A(H1N1)v, see under *Celvapan*® and *Pandemrix*® below

Seasonal influenza vaccines for intramuscular use

Inactivated Influenza Vaccine (Split Virion) PoM

Flu

Injection, suspension of formaldehyde-inactivated influenza virus (split virion grown in fertilised hens' egg's), net price 0.25-mL prefilled syringe = £6.29; 0.5-mL prefilled syringe = £6.29

Excipients may include neomycin and polymyxin

Available from Sanofi Pasteur

Contra-indications avoid preparations marketed by Pfizer, Wyeth, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

Inactivated Influenza Vaccine (Surface Antigen) PoM

Flu or Flu(adj)

Injection, suspension of propiolactone-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £4.15

Excipients may include neomycin and polymyxin B, and traces of thiomersal

Available from Novartis Vaccines

Note Not licensed for children under 4 years

Agrippal® (Novartis Vaccines) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.85

Excipients include kanamycin and neomycin

Begrivac® (Novartis Vaccines) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.85

Excipients include polymyxin B

Enzira® (Pfizer) PoM

Injection, suspension of inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £6.33

Excipients include neomycin and polymyxin B

Contra-indications child under 5 years—increased risk of febrile convulsions

Fluarix® (GSK) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.39

Excipients include gentamicin

Fluvirin® (Novartis Vaccines) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.55

Excipients include neomycin, polymyxin B, and traces of thiomersal

Note Not licensed for use in children under 4 years

Imuvac® (Abbott) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £6.59

Excipients include gentamicin

Influvac Sub-unit® (Abbott) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £5.22

Excipients include gentamicin

Mastaflu® (MASTA) PoM

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £6.50

Excipients include gentamicin

Viroflu® (Crucell) PoM

Injection, suspension of inactivated influenza virus (surface antigen, virosome, grown in fertilised hens' eggs), net price 0.5-mL prefilled syringe = £6.33

Excipients include neomycin and polymixin B

Seasonal influenza vaccine for intradermal use

Intanza® (Sanofi Pasteur) ▼ PoM

Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price, prefilled syringe, 9 micrograms (0.1 mL) = £9.05; prefilled syringe, 15 micrograms (0.1 mL) = £9.05

Excipients include neomycin

Dose by intradermal injection into deltoid region, ADULT 18–60 years, 9 micrograms as a single dose; ADULT over 60 years, 15 micrograms as a single dose

Monovalent influenza A(H1N1)v vaccines

Celvapan® (Baxter) ▼ PoM

Injection, suspension of formaldehyde-inactivated influenza A(H1N1)v virus (whole virion, grown in vero cells), 15 micrograms/mL, 5-mL multidose vial contains 10 doses of 0.5 mL

Dose prevention of influenza A(H1N1)v, by intramuscular injection, ADULT and CHILD over 6 months, 2 doses each of 0.5 mL separated by an interval of at least 3 weeks

Note *Celvapan®* is not interchangeable with *Pandemrix®*

Pandemrix® (GSK) ▼ PoM

Injection, suspension of inactivated influenza A(H1N1)v virus (split virion, grown in fertilised hens' eggs) 7.5 micrograms/mL when mixed with emulsion of adjuvant, 5 mL of mixed multidose vial contains 10 doses of 0.5 mL

Excipients include gentamicin and thiomersal

Dose prevention of influenza A(H1N1)v, by intramuscular injection, ADULT and CHILD over 10 years, 0.5 mL as a single dose; CHILD 6 months –10 years, a single dose of 0.25 mL

Note *Pandemrix®* is not interchangeable with *Celvapan®*

Japanese encephalitis vaccine

Japanese encephalitis vaccine is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org)

JAPANESE ENCEPHALITIS VACCINE

Indications immunisation against Japanese encephalitis

Cautions see section 14.1

Contra-indications see section 14.1; hypersensitivity reaction after first dose—do not give the second dose

Pregnancy although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy

Breast-feeding see p. 747

Side-effects see section 14.1; also *less commonly* migraine, vertigo, pharyngolaryngeal pain

Dose

- See under preparation

[1]**Ixiaro®** (Novartis Vaccines) ▼ PoM NHS

Injection, suspension, inactivated Japanese encephalitis virus (produced in Vero cells), adsorbed onto aluminium hydroxide, net price 0.5-mL (6 micrograms) prefilled syringe = £48.00

Dose by intramuscular injection in deltoid region, ADULT over 18 years 2 doses of 0.5 mL separated by interval of 28 days; booster dose 1–2 years after completing primary course, but for those at continued risk the booster dose should be given 1 year after completing the primary course

Note *Ixiaro®* doses differ from the other previously available unlicensed Japanese encephalitis vaccines

Measles vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

Single antigen vaccine

No longer available in the UK

Combined vaccines

See MMR vaccine

Measles, Mumps and Rubella (MMR) vaccine

A combined live **measles, mumps, and rubella vaccine** (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting school at 3–5 years of age (see Immunisation Schedule, section 14.1

When protection against measles is required urgently (e.g. during a measles outbreak), the second dose of MMR vaccine can be given 1 month after the first dose; if the second dose is given before 18 months of age, then children should still receive the routine dose before starting school at 3–5 years of age.

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose. At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In a young adult who has received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after initial dose.

1. Japanese encephalitis vaccine not prescribable on the NHS; health authorities may investigate circumstances under which vaccine prescribed

MMR vaccine should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. MMR vaccine may also be offered to previously *unimmunised and seronegative post-partum women*—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection; these children should still receive routine MMR vaccinations at the recommended ages. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5.1) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5.1).

Travel Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR at the recommended ages. If one dose of MMR has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3–5 years should still be given.

Side-effects See section 14.1; also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Hypersensitivity to egg— there is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat eggs is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine should be administered in a hospital setting.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura *within 6 weeks* of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from:
www.dh.gov.uk/immunisation

MEASLES, MUMPS AND RUBELLA VACCINE, LIVE

Indications immunisation against measles, mumps, and rubella

Cautions see section 14.1; also, after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced—see also p. 772; **interactions:** Appendix 1 (vaccines)

Hypersensitivity to egg There is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat egg is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine may be administered in a hospital setting

Contra-indications see section 14.1

Pregnancy avoid pregnancy for at least 1 month after vaccination; see also, p. 747

Breast-feeding see p. 747

Side-effects see section 14.1 and notes above; also *less commonly* sleep disturbances, unusual crying in infants; also reported peripheral and optic neuritis

Dose

- By intramuscular or deep subcutaneous injection, ADULT and CHILD over 9 months (but see also notes above), primary immunisation, 2 doses each of 0.5 mL, see Immunisation Schedule, section 14.1, p. 748; see also notes above for use in outbreaks, for contacts of cases, and for travel

Combined vaccines

MMRvaxPro® (Sanofi Pasteur) ▼ PoM

Injection, powder for reconstitution, live attenuated, measles virus (Enders' Edmonston strain) and mumps virus (Jeryl Lynn strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent)

Excipients include gelatin and neomycin

Only available as part of childhood immunisation schedule from health organisations or Movianto

Priorix® (GSK) PoM

Injection, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); net price single-dose vial (with syringe containing solvent) = £6.37

Excipients include neomycin

Also available as part of childhood immunisation schedule from health organisations or Movianto

Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serotypes A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serotype C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

Childhood immunisation **Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 2 doses given at 3 months and 4 months of age; a booster should be given at 12–13 months of age, usually combined with haemophilus influenzae type b vaccine (see Immunisation Schedule, section 14.1, p. 748).

It is recommended that meningococcal group C conjugate vaccine be given to anyone aged under 25 years who has not been vaccinated previously with this vaccine; those over 1 year receive a single dose.

A single dose of meningococcal group C conjugate vaccine is also recommended for unimmunised individuals attending university, irrespective of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Asplenia or splenic dysfunction Children under 1 year should be vaccinated according to the Immunisation Schedule (section 14.1), but should receive 2 doses of meningococcal A, C, W135, and Y conjugate vaccine at 3 months and 4 months of age instead of the meningococcal group C conjugate vaccine; these children should also receive one dose of meningococcal group C conjugate vaccine (combined with haemophilus influenzae type b vaccine) at 12 months of age, followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. Unimmunised adults and children over 1 year should be given 1 dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. Immunised adults and children who develop splenic dysfunction should be given 1 additional dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by a single dose of meningococcal A, C, W135, and Y conjugate vaccine.

Complement deficiency Unimmunised adults and children over 1 year of age with complement deficiency should be given 1 dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by 1 dose of meningococcal A, C, W135 and Y conjugate vaccine. Immunised adults and children, who subsequently become complement deficient, should be given 1 dose of meningococcal A, C, W135 and Y conjugate vaccine at least 2 months after the last dose of meningococcal group C conjugate vaccine.

Travel Individuals travelling to countries of risk (see below) should be immunised with **meningococcal A, C, W135, and Y conjugate vaccine**, even if they have previously received meningitis C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (A, C, W135, and Y) meningococcal vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

MENINGOCOCCAL VACCINES

Indications immunisation against *Neisseria meningitidis*

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also *rarely* symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)

Dose

- See under preparations

Meningococcal group C conjugate vaccine

Meningitec® (Wyeth) PoM

Injection, suspension of capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £7.50

Dose by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose; for routine immunisation in CHILD 2 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Available as part of childhood immunisation schedule from Movianto

Menjugate Kit® (Sanofi Pasteur) PoM

Injection, powder for reconstitution, capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium hydroxide, single-dose vial with diluent

Dose by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose; for routine immunisation in CHILD 2 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Available as part of childhood immunisation schedule from Movianto

NeisVac-C® (Baxter) PoM

Injection, suspension of polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to tetanus toxoid protein), adsorbed onto aluminium hydroxide, 0.5-mL prefilled syringe

Dose by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose; for routine immunisation in CHILD 2 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Available as part of childhood immunisation schedule from Movianto

Meningococcal Group C conjugate vaccine with Haemophilus Influenzae type B vaccine

See Haemophilus Influenzae type B vaccine

Meningococcal A, C, W135, and Y conjugate vaccine

Menveo® (Novartis Vaccines) ▼ PoM

Injection, powder for reconstitution, capsular oligosaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to *Corynebacterium diphtheriae* protein), net price single-dose vial (with syringe containing diluent) = £40.01

Dose by intramuscular injection preferably into deltoid region, ADULT and CHILD 0.5 mL as a single dose; CHILD under 1 year with asplenia or splenic dysfunction (see p. 761), 0.5 mL

Note Advice in BNF may differ from that in product literature

Meningococcal polysaccharide A, C, W135 and Y vaccine

ACWY Vax® (GSK) ▼ PoM

Injection, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £16.73

Dose by deep subcutaneous injection, ADULT and CHILD over 5 years 0.5 mL as a single dose; booster dose for those at continued risk, 0.5 mL 5 years after initial dose

Mumps vaccine

Single antigen vaccine

No longer available in the UK

Combined vaccines

See MMR Vaccine

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines (see Diphtheria containing Vaccines). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months.

A booster dose of an acellular pertussis-containing vaccine should be given 3 years after the primary course.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not currently recommended in individuals over 10 years of age.

Cautions Section 14.1.

Contra-indications Section 14.1.

Pregnancy See p. 747.

Breast-feeding See p. 747.

Side-effects See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Combined vaccines

Combined vaccines, see under Diphtheria-containing vaccines

Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine (adsorbed)** contains polysaccharide from either 10 capsular types (*Synflorix*®) or 13 capsular types (*Prevenar 13*®) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13*®) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, and chemotherapy; patients should be given advice about increased risk of pneumococcal infection. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

Choice of vaccine Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

PNEUMOCOCCAL VACCINE

Indications immunisation against pneumococcal infection

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; *also* Revaccination, above

Dose

- See under preparations

Pneumococcal polysaccharide vaccine

Pneumovax® II (Sanofi Pasteur) PoM

Injection, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.32

Dose by intramuscular or subcutaneous injection, ADULT and CHILD over 2 years, 0.5 mL; revaccination, see notes above

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

Prevenar 13® (Wyeth) ▼ PoM

Injection, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £49.10

Dose by intramuscular injection, CHILD 2 months–5 years, 0.5 mL (see notes above and Immunisation schedule, section 14.1)

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants.

The dose in the BNF may differ from that in product literature.

Available as part of childhood immunisation schedule from Movianto

Synflorix® (GSK) ▼ PoM

Injection, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £27.60

Dose by intramuscular injection, CHILD 6 weeks–2 years, consult product literature

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Poliomyelitis vaccines

Two types of poliomyelitis vaccine (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated poliomyelitis vaccine**, only available in combined preparation (see under Diphtheria Vaccines), is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Preparations containing inactivated poliomyelitis vaccine can be used to complete an immunisation course initiated with the live (oral) poliomyelitis vaccine. **Live (oral) poliomyelitis vaccine** is available only for use during outbreaks. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

Travel Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

POLIOMYELITIS VACCINES

Indications immunisation against poliomyelitis

Cautions see section 14.1; *also for live vaccine*, **interactions:** Appendix 1 (vaccines)

Contra-indications see notes above and section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see notes above and section 14.1

Dose

- See under preparations

Combined vaccines

See under Diphtheria-containing Vaccines

Inactivated (Salk) vaccine

See under Diphtheria-containing vaccines

Live (oral) (Sabin) vaccine

Poliomyelitis Vaccine, Live (Oral) (GSK) PoM

OPV

A suspension of suitable live attenuated strains of poliomyelitis virus, types 1, 2, and 3. Available in single-dose and 10-dose containers

Excipients include neomycin and polymyxin B

Dose control of outbreaks, 3 drops; may be given on a lump of sugar; not to be given with foods which contain preservatives

Note Live poliomyelitis vaccine loses potency once the container has been opened—any vaccine remaining at the end of an immunisation session should be discarded; whenever possible sessions should be arranged to avoid undue wastage.

Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org)

and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at continued risk . To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the Health Protection Agency Virus Reference Department, Colindale, London (tel. (020) 8200 4400) or the Centre for Infections (tel. (020) 8200 6868), in Scotland from Health Protection Scotland (tel. (0141) 300 1100), in Northern Ireland from the Public Health Laboratory, Belfast City Hospital (tel. (028) 9032 9241).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine, given on day 0 and day 3, are likely to be sufficient. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and 30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given on day 0. The immunisation course can be discontinued if it is proved that the individual was not at risk.

RABIES VACCINE

Indications immunisation against rabies

Cautions see section 14.1

Contra-indications see section 14.1; but see also Post-exposure Management in notes above

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also reported paresis

Dose

- Pre-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL on days 0, 7, and 21 or 28; for those at continued risk give a single reinforcing dose 1 year after the primary course is completed and booster doses every 3–5 years; for those at intermittent risk give booster doses every 2–5 years
- Post-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

Rabies Vaccine (Sanofi Pasteur) PoM

Rab

Injection, powder for reconstitution, freeze-dried inactivated Wistar rabies virus strain PM/WI 38 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £31.90

Excipients include neomycin

Rabipur® (Novartis Vaccines) PoM

Injection, powder for reconstitution, freeze-dried inactivated Flury LEP rabies virus strain cultivated in chick embryo cells, net price single-dose vial = £28.80

Excipients include neomycin

Rotavirus vaccine

Rotavirus vaccine a live, oral vaccine is licensed for immunisation of infants over 6 weeks of age for protection against gastro-enteritis caused by rotavirus infection. The vaccine is not included in the childhood immunisation schedule.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; the vaccine should be used with caution in those with *immunosuppressed* close contacts. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

ROTAVIRUS VACCINE

Indications immunisation against gastro-enteritis caused by rotavirus

Cautions see section 14.1; *also* diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above); **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1; *also* predisposition to, or history of, intussusception

Side-effects see section 14.1

Dose

- By mouth, CHILD over 6 weeks, 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; course should be completed before 24 weeks of age (preferably before 16 weeks)

Rotarix® (GSK) ▼ PoM

Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL prefilled oral syringe = £41.38

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do

not have immunity against rubella (see MMR vaccine, p. 759)

Single antigen vaccine

No longer available in the UK; the combined live measles, mumps and rubella vaccine is a suitable alternative

Combined vaccines

see MMR vaccine

Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Health Protection Agency (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at www.dh.gov.uk

Tetanus vaccines

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

Cautions See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

Contra-indications See section 14.1.

Pregnancy See p. 747.

Breast-feeding See p. 747.

Side effects See section 14.1.

Wounds Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment *or* at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) *or* show much devitalised tissue *or* are septic *or* are compound fractures *or* contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Combined vaccines

See Diphtheria-containing Vaccines

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED

Indications immunisation against tick-borne encephalitis

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1

Dose

- Initial immunisation, by intramuscular injection in deltoid region or anterolateral thigh in infants, ADULT and CHILD over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; CHILD 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; ELDERLY over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  Note To achieve more rapid protection, second dose may be given 14 days after first dose
- Booster doses, give first dose within 3 years after initial course completed, then every 3–5 years

TicoVac® (MASTA) PoM

Injection, suspension, formaldehyde-inactivated Neudörfl tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25–mL prefilled syringe (*TicoVac Junior®*) = £28.00, 0.5-mL prefilled syringe = £32.00

Excipients include gentamicin and neomycin

Typhoid vaccines

Typhoid vaccine is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* for oral use.

Typhoid immunisation is advised for

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely
- laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi*

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 774).

Capsular **polysaccharide typhoid vaccine** is usually given by *intramuscular injection*. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Booster doses are needed every 3 years on continued exposure.

Oral typhoid vaccine is a **live attenuated** vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but occasional travellers require further courses at intervals of 1 year.

Interactions Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- *Mefloquine* should be avoided for at least 12 hours before or after oral typhoid; vaccination with oral typhoid should preferably be completed at least 3 days before the first dose of mefloquine;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

TYPHOID VACCINE

Indications immunisation against typhoid fever

Cautions section 14.1; **interactions:** see above and Appendix 1 (vaccines)

Contra-indications section 14.1; also for *oral* vaccine, acute gastro-intestinal illness

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects section 14.1

Dose

- See under preparations

Typhoid polysaccharide vaccine for injection

Typherix® (GSK) PoM

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.93

Dose by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection; CHILD under 2 years (see notes above)

Typhim Vi® (Sanofi Pasteur) PoM

Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.00

Dose by intramuscular injection, 0.5 mL, at least 2 weeks before potential exposure to typhoid infection CHILD under 2 years (see notes above)

Polysaccharide vaccine with hepatitis A vaccine

See Hepatitis A Vaccine

Typhoid vaccine, live (oral)

Vivotif® (Crucell) PoM

Capsules, e/c, live attenuated *Salmonella typhi* (Ty21a), net price 3-cap pack = £14.77. Label: 23, 25, counselling, administration

Dose ADULT and CHILD over 6 years, 1 capsule on days 1, 3, and 5

Counselling Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

Varicella–zoster vaccine

Varicella–zoster vaccine (live) is licensed for immunisation against varicella in seronegative individuals. It is not recommended for routine use in children but can be

given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends varicella–zoster vaccine for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

Varicella–zoster immunoglobulin is used to protect susceptible individuals at increased risk of varicella infection, see p. 772.

VARICELLA-ZOSTER VACCINE

Indications immunisation against varicella infection (see notes above)

Cautions see section 14.1; *also* post-vaccination close-contact with susceptible individuals (see notes above); **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1

Pregnancy avoid pregnancy for 3 months after vaccination; see also p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also varicella-like rash; *rarely* thrombocytopenia

Dose

- See under preparations

Varilrix® (GSK) PoM

Injection, powder for reconstitution, live attenuated varicella–zoster virus (Oka strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

Excipients include neomycin

Dose by subcutaneous injection preferably into deltoid region, ADULT and CHILD over 1 year (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

Varivax® (Sanofi Pasteur) ▼ PoM

Injection powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £30.28

Excipients include gelatin and neomycin

Dose by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks; CHILD 1–13 years (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (two doses separated by 12 weeks in children with asymptomatic HIV infection)

Yellow fever vaccine

Live yellow fever vaccine is indicated for those travelling or living in areas where infection is endemic (see p. 774) and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rare, vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These *very rare* adverse effects usually have occurred after the first dose of yellow fever vaccine in those with no previous immunity.

Pregnancy Live yellow fever vaccine should not be given during pregnancy, but if a significant risk of exposure cannot be avoided then vaccination should be delayed to the third trimester if possible (but the need for immunisation usually outweighs risk to the fetus).

Breast-feeding Vaccination should be considered in breast-feeding women when there is a real risk to the mother from yellow fever disease.

YELLOW FEVER VACCINE, LIVE

Indications immunisation against yellow fever

Cautions see section 14.1; *also* individuals over 60 years—greater risk of vaccine-associated adverse effects, see notes above; **interactions:** Appendix 1 (vaccines)

Contra-indications see section 14.1 and notes above; *also* children under 6 months; history of thymus dysfunction

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see section 14.1; also reported neurotropic disease and viscerotropic disease (see notes above)

Dose

- By deep subcutaneous injection, ADULT and CHILD over 9 months, 0.5 mL (see also notes above)

Yellow Fever Vaccine, Live PoM

Yel(live)

Injection, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as *Stamaril®*

14.5 Immunoglobulins

14.5.1 Normal immunoglobulin
14.5.2 Disease-specific immunoglobulins
14.5.3 Anti-D (Rh_0) immunoglobulin

Two types of human immunoglobulin preparation are available, **normal immunoglobulin** and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK (for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.dh.gov.uk.

Immunoglobulins of animal origin (antisera were frequently associated with hypersensitivity reactions and are no longer used.

Further information on the use of immunoglobulins is included in the Health Protection Agency's *Immunoglobulin Handbook* www.hpa.org.uk, and in the Department of Health's publication, *Immunisation against Infectious Disease*, www.dh.gov.uk.

Availability **Normal immunoglobulin** for intramuscular administration is available from some regional Health Protection Agencies and microbiology laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles and rubella, only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins (section 14.5.2) are available from some regional Health Protection Agencies and microbiology laboratories, with the exception of **tetanus immunoglobulin** which is available from BPL, hospital pharmacies, or blood transfusion departments. **Rabies immunoglobulin** is available from the Specialist and Reference Microbiology Division, Health Protection Agency. **Hepatitis B immunoglobulin** required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS)

14.5.1 Normal immunoglobulin

Human **normal immunoglobulin** ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given **at least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Uses Normal immunoglobulin (containing 10%–18%) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A** virus (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki syndrome; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* (www.dh.gov.uk).

Hepatitis A **Hepatitis A vaccine** is preferred for individuals at risk of infection (see p. 754) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children and adults with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of

measles or with a person associated with a local outbreak:

- non-immune pregnant women;
- infants under 9 months.

Further advice should be sought from the Centre for Infections, Health Protection Agency (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

Rubella Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see MMR vaccine (p. 759).

NORMAL IMMUNOGLOBULIN

Indications see notes above

Cautions hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 769

Intravenous use thrombophilic disorders, or risk factors for arterial or venous thromboembolic events; obesity; ensure adequate hydration, renal insufficiency

Contra-indications patients with selective IgA deficiency who have known antibody against IgA

Renal impairment monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure

Side-effects nausea, diarrhoea, chills, fever, headache, dizziness, arthralgia, myalgia, muscle spasms, low back pain; *rarely* hypotension, anaphylaxis, cutaneous skin reactions, aseptic meningitis, acute renal failure; also reported with *intravenous use*, injection site reactions, abdominal pain and distension, blood pressure fluctuations, haemolytic anaemia, thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

Note Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

Dose

- See under preparations

Note Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

For intramuscular use

Normal Immunoglobulin PoM

Normal immunoglobulin injection. 250-mg vial; 750-mg vial

Dose by deep intramuscular injection, to control outbreaks of hepatitis A (see notes above), 500 mg; CHILD under 10 years 250 mg

Rubella in pregnancy, prevention of clinical attack, 750 mg

Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)

For subcutaneous use

Subcuvia® (Baxter) PoM

Normal immunoglobulin (protein 16%) injection, net price 5-mL vial = £32.56, 10-mL vial = £65.12

Dose by subcutaneous injection, ADULT and CHILD over 12 years antibody deficiency syndromes, consult product literature

Note May be administered by intramuscular injection (if subcutaneous route not possible) but **not** for patients with thrombocytopenia or other bleeding disorders

Subgam® (BPL) PoM

Normal immunoglobulin (protein 14%-18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £28.50, 1.5-g vial = £57.00

Dose by subcutaneous injection, antibody deficiency syndromes, consult product literature

By intramuscular injection, Hepatitis A prophylaxis in outbreaks (see notes above), ADULT and CHILD over 10 years, 750 mg, CHILD under 10 years, 500 mg

Rubella, in pregnancy, prevention of clinical attack (see also notes above), 750 mg

Note *Subgam®* is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A or rubella

Vivaglobin® (CSL Behring) PoM

Normal immunoglobulin (protein 16%) injection, net price 3-mL vial = £17.76, 10-mL vial = £59.20, 20-mL vial = £118.40

Dose by subcutaneous injection, antibody deficiency syndromes, consult product literature

For intravenous use

Note Dose recommendation for Kawasaki's syndrome, see *BNF for Children*; other indications—consult product literature for dosage regimens

Flebogammadif® (Grifols) ▼ PoM

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00, 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00

Note Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Gammagard S/D® (Baxter) PoM

Intravenous infusion, (providing protein 5% or 10%), net price 0.5 g (with diluent) = £20.05, 2.5 g (with diluent) = £100.25, 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00

Gammaplex® (BPL) ▼ PoM

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £85.00, 5 g (100 mL) = £170.00, 10 g (200 mL) = £340.00

Note Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

Intratect® (Biotest UK) ▼ PoM

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00,

Kiovig® (Baxter) PoM

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00,

Note Use Glucose 5% intravenous infusion, if dilution prior to administration is required

Privigen® (CSL Behring) ▼ PoM

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £135.00, 5 g (50 mL) = £270.00, 10 g (100 mL) = £540.00, 20 g (200 mL) = £1080.00

Note Contains L-proline; contra-indicated in patients with hyperprolinaemia

Vigam® (BPL) PoM

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £190.00, 10 g (200 mL) = £380.00

Note Contains sucrose (see Renal impairment, above)

14.5.2 Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.hpa.org.uk).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

Hepatitis B

Disease-specific **hepatitis B immunoglobulin** ('HBIG') is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 755). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given in different sites.

An intravenous and subcutaneous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

HEPATITIS B IMMUNOGLOBULIN

Indications prophylaxis against hepatitis B infection

Cautions IgA deficiency; interference with live virus vaccines see under Normal Immunoglobulin, p. 769.

Side-effects injection site reactions; less frequently, buccal ulceration, glossitis, abdominal pain, chest pain, dyspnoea, anaphylaxis, tremor, dizziness, headache, arthralgia; for side-effects associated with intravenous immunoglobulin, see section 14.5.1

Dose

- See under preparations and see also notes above

For intramuscular use

Hepatitis B Immunoglobulin PoM

Injection, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 769), also available from BPL

Dose by intramuscular injection (as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure), ADULT and CHILD over 10 years 500 units; CHILD under 5 years 200 units, 5–9 years 300 units; NEONATE 200 units

Prevention of transmitted infection at birth, NEONATE 200 units as soon as possible after birth; for full details consult *Immunisation against Infectious Disease* (www.dh.gov.uk)

For intravenous use

Note Hepatitis B immunoglobulin for *intravenous use* is available from BPL on a named-patient basis

Hepatect® CP (Biotest UK) PoM

Intravenous infusion, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00

Dose by intravenous infusion, after exposure to hepatitis B virus-contaminated material—consult product literature

Prevention of transmitted infection at birth—consult product literature

Prevention of hepatitis B in haemodialysed patients, prophylaxis against re-infection of transplanted liver—consult product literature

For subcutaneous use

Zutectra® (Biotest UK) ▼ PoM

Injection, hepatitis B-specific immunoglobulin, 500 units/mL, net price 5 × 1-mL prefilled syringes = £1500.00

Dose prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients starting 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin, by subcutaneous injection, ADULT body-weight under 75 kg 500 units once weekly, increased if necessary up to 1000 units once weekly; body-weight over 75 kg 1000 units once weekly

Rabies

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies vaccine p. 764)

RABIES IMMUNOGLOBULIN

Indications post-exposure prophylaxis against rabies infection

Cautions IgA deficiency; interference with live virus vaccines—see p. 769 under Normal Immunoglobulin

Side-effects injection site swelling and pain; *very rarely* anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

Dose

- See under preparation

Rabies Immunoglobulin PoM
(Antirabies Immunoglobulin Injection)
See notes above
Dose 20 units/kg by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
Note The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose
Available from Specialist and Reference Microbiology Division, Health Protection Agency (see section 14.5 under availability) (also from BPL)

Tetanus

For the management of tetanus-prone wounds, **tetanus immunoglobulin** should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (see Diphtheria-containing Vaccines, section 14.4). Tetanus immunoglobulin, together with metronidazole (section 5.1.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

TETANUS IMMUNOGLOBULIN

Indications post-exposure prophylaxis and treatment of tetanus infection
Cautions IgA deficiency; interference with live virus vaccines—see p. 769
Side-effects injection site swelling and pain; *rarely* anaphylaxis
Dose
- Post-exposure prophylaxis, by intramuscular injection 250 units, increased to 500 units if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- Treatment of tetanus infection, by intramuscular injection 150 units/kg (multiple sites)

Tetanus Immunoglobulin PoM
(Antitetanus Immunoglobulin Injection)
Available from BPL
Note May be difficult to obtain

Varicella–zoster

Varicella–zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella *and* who have no antibodies to varicella–zoster virus *and* who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; *children* 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; *adults* about 40 mg daily for more than 1 week.

Important: for full details consult *Immunisation against Infectious Disease*. **Varicella–zoster vaccine** is available—see section 14.4. For treatment of varicella–zoster infections, see section 5.3.2.1

VARICELLA–ZOSTER IMMUNOGLOBULIN

Indications prophylaxis against varicella infection
Cautions IgA deficiency; interference with live virus vaccines—see p. 769
Side-effects injection site swelling and pain; *rarely* anaphylaxis
Dose
- By intramuscular injection, prophylaxis (as soon as possible—not later than 10 days after exposure), ADULT and CHILD over 14 years, 1 g; NEONATE, INFANT and CHILD up to 5 years 250 mg, 5–10 years 500 mg, 10–14 years 750 mg; give second dose if further exposure occurs more than 3 weeks after first dose
  Note No evidence that effective in treatment of severe disease. Normal immunoglobulin for intravenous use (section 14.5.1) may be used in those unable to receive intramuscular injections

Varicella–Zoster Immunoglobulin PoM
(Antivaricella–zoster Immunoglobulin)

Available from selected Health Protection Agency and NHS laboratories; (see section 14.5 under Availability); also from BPL

14.5.3 Anti-D (Rh_0) immunoglobulin

Anti-D (Rh_0) immunoglobulin is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh_0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh_0) immunoglobulin is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis NICE recommends that two doses of either 500 units *or* 1000–1650 units of anti-D immunoglobulin should be given, the first at 28 weeks' gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used (see also NICE guidance below).

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a

sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

NICE guidance
Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

Note
MMR vaccine may be given in the postpartum period with anti-D (Rh_0) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh_0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

ANTI-D (Rh_0) IMMUNOGLOBULIN

Indications see notes above

Cautions immunoglobulin A deficiency; possible interference with live virus vaccines, see under p. 769, but see notes above about administration with MMR vaccine

Contra-indications treatment of idiopathic thrombocytopenia purpura in rhesus negative or splenectomised patients

Side-effects nausea, vomiting, diarrhoea, abdominal pain; hypotension, hypertension, headache, fever, malaise, asthenia, drowsiness, dizziness, back pain, arthralgia, myalgia; pruritus, rash, sweating, injection site pain; *rarely* tachycardia, anaphylaxis, dyspnoea, hypotension, and urticaria; (for side-effects associated with *intravenous* immunoglobulins, see section 14.5.1

Dose

- See preparations below

Anti-D (Rh_0) Immunoglobulin PoM
Injection, anti-D (Rh_0) immunoglobulin, net price 250-unit vial = £19.00, 500-unit vial = £27.00, 1500-unit vial = £58.00, 2500-unit vial = £94.40
Dose by deep intramuscular injection, to rhesus-negative woman for prevention of Rh_0(D) sensitisation:
Following birth of rhesus-positive infant, 500 units immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells
Following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation 250 units per episode (after 20 weeks, 500 units) immediately or within 72 hours
Antenatal prophylaxis, 500 units given at weeks 28 and 34 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery
Following Rh_0(D) incompatible blood transfusion, 100–125 units per mL transfused rhesus-positive red cells
Note Subcutaneous route used for patients with bleeding disorders
Available from Blood Centres and from BPL (*D-Gam*®)

Partobulin SDF® (Baxter) PoM
Injection, anti-D (Rh_0) immunoglobulin 1250 units/mL (250 micrograms/mL), net price 1-mL prefilled syringe = £35.00
Dose by intramuscular injection, to rhesus-negative woman for prevention of Rh_0 (D) sensitisation:
Following birth of rhesus-positive infant, 1000–1650 units immediately or within 72 hours; for large transplacental blood loss, 50–125 units per mL of fetal red cells
Antenatal prophylaxis, 1000–1650 units given at weeks 28 and 34 of pregnancy; if infant rhesus-positive, further dose is needed immediately or within 72 hours of delivery
Following abortion, ectopic pregnancy or hydatidiform mole up to 12 weeks' gestation, 600–750 units (after 12 weeks, 1250–1650 units) immediately or within 72 hours
Following amniocentesis or chorionic villous sampling, 1250–1650 units immediately or within 72 hours
Following Rh_0 (D) incompatible blood or red cell transfusion, 1250 units per 10 mL of transfused rhesus-positive red cells immediately or within 72 hours
Note Subcutaneous route recommended for patients with bleeding disorders.

Rhophylac® (CSL Behring) PoM
Injection, anti-D (Rh_0) immunoglobulin 750 units/mL (150 micrograms/mL), net price 2-mL (1500-unit) prefilled syringe = £46.50.
Dose by intramuscular *or* intravenous injection, to rhesus-negative woman for prevention of Rh_0(D) sensitisation:
Following birth of rhesus-positive infant, 1000–1500 units immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection)
Following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation 1000 units per episode (after 12 weeks, higher doses may be required) immediately or within 72 hours
Antenatal prophylaxis, 1500 units given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery
Following Rh_0(D) incompatible blood transfusion, by intravenous injection, 50 units per mL transfused rhesus-positive blood (or 100 units per mL of erythrocyte concentrate)
Note Intravenous route recommended for patients with bleeding disorders.

14.6 International travel

Note For advice on **malaria chemoprophylaxis**, see section 5.4.1.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); see also Tick-borne Encephalitis, p. 766. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine (see p. 764). BCG immunisation (see p. 750) is recommended for travellers aged under 16 years[1] pro-

1. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients

posing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000[1]; it should preferably be given 3 months or more before departure.

Monovalent influenza A(H1N1)v vaccine (see p. 758) can be offered to travellers visiting countries in the southern hemisphere during their influenza season.

Yellow fever immunisation (see p. 768) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world (for details, see p. 761).

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 754) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 769). Special care must also be taken with food hygiene (see below).

Hepatitis B vaccine (see p. 755) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** (see p. 764) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 752), even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine (see p. 767) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** (see p. 751) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on **diphtheria** (see p. 752), on **Japanese encephalitis**[2] (see p. 759) and on **tick-borne encephalitis** (see p. 766) is included in *Health Information for Overseas Travel*, see below.

Food hygiene In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from:
www.nathnac.org
The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information *for healthcare professionals* regarding health advice for travellers, can also be obtained here.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

15 Anaesthesia

15.1 General anaesthesia 746
15.1.1 Intravenous anaesthetics 776
15.1.2 Inhalational anaesthetics 779
15.1.3 Antimuscarinic drugs 781
15.1.4 Sedative and analgesic peri-operative drugs 782
15.1.4.1 Anxiolytics 783
15.1.4.2 Non-opioid analgesics 785
15.1.4.3 Opioid analgesics 786
15.1.5 Neuromuscular blocking drugs 788
15.1.6 Drugs for reversal of neuromuscular blockade 791
15.1.7 Antagonists for central and respiratory depression 792
15.1.8 Drugs for malignant hyperthermia 793
15.2 Local anaesthesia 793

15.1 General anaesthesia

15.1.1 Intravenous anaesthetics
15.1.2 Inhalational anaesthetics
15.1.3 Antimuscarinic drugs
15.1.4 Sedative and analgesic peri-operative drugs
15.1.5 Neuromuscular blocking drugs
15.1.6 Drugs for reversal of neuromuscular blockade
15.1.7 Antagonists for central and respiratory depression
15.1.8 Drugs for malignant hyperthermia

Important
The drugs in section 15.1 should be used by experienced personnel only and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Surgery and long-term medication The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1, p. 421.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. MAOIs can have important interactions with some drugs used during surgery, such as pethidine (for interactions of MAOIs, see Appendix 1, MAOIs). Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery.

Anaesthesia and driving Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

Prophylaxis of acid aspiration Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

An **H_2-receptor antagonist** (section 1.3.1) or a **proton pump inhibitor** (section 1.3.5), such as omeprazole, can be used before surgery to increase the pH and reduce the volume of gastric fluid. They do not affect the pH of fluid already in the stomach and this limits their value in emergency procedures; oral H_2-receptor antagonists can be given 1–2 hours before the procedure, but omeprazole must be given at least 12 hours earlier. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

Gas cylinders

Each gas cylinder bears a label with the name of the gas contained in the cylinder. The name or chemical symbol of the gas appears on the shoulder of the cylinder and is also clearly and indelibly stamped on the cylinder valve.

The colours on the valve end of the cylinder extend down to the shoulder; in the case of mixed gases the colours for the individual gases are applied in four segments, two for each colour.

Gas cylinders should be stored in a cool well-ventilated room, free from flammable materials.

No lubricant of any description should be used on the cylinder valves.

Anaesthesia, sedation, and resuscitation in dental practice

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003. Both documents are available at www.dh.gov.uk.
Guidance is also included in *Standards for Dental Professionals*, London, General Dental Council, May 2005 (and as amended subsequently), and *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, May 2006.

15.1.1 Intravenous anaesthetics

Important
The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities **must** be available. They are **contraindicated** if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'). The doses and rates of administration should be reduced in the elderly, and particularly in those with hypovolaemia or cardiovascular disease; lower doses may also be required in premedicated patients.

Total intravenous anaesthesia This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

Anaesthesia and driving See section 15.1.

Drugs used for intravenous anaesthesia

Propofol, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates.

Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes pain on intravenous injection, which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures. In adults, it can be used for sedation in intensive care, but it is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, cardiac failure, rhabdomyolysis, hyperlipidaemia, and hepatomegaly).

Thiopental sodium is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia.

Ketamine is used rarely. Ketamine causes less hypotension than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam.

ETOMIDATE

Indications induction of anaesthesia

Cautions see under Intravenous Anaesthetics and notes above; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see under Intravenous Anaesthetics and notes above

Hepatic impairment reduce dose in liver cirrhosis

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also nausea, vomiting; hypotension; apnoea, hyperventilation, stridor; rash; *less commonly* hypersalivation, arrhythmia, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

Dose

- See under preparations

Etomidate-Lipuro® (Braun) PoM

Injection (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.53

Dose ADULT and CHILD over 6 months, by slow intravenous injection, 150–300 micrograms/kg; CHILD under 10 years may need up to 400 micrograms/kg, ELDERLY 150–200 micrograms/kg

Hypnomidate® (Janssen-Cilag) PoM

Injection, etomidate 2 mg/mL, net price 10-mL amp = £1.38

Excipients include propylene glycol (see Excipients, p. 2)

Dose ADULT and CHILD, by slow intravenous injection, 300 micrograms/kg (max. total dose 60 mg); ELDERLY 150–200 micrograms/kg (max. total dose 60 mg)

KETAMINE

Indications induction and maintenance of anaesthesia (but rarely used)

Cautions see under Intravenous Anaesthetics and notes above; dehydration; hypertension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotic disorders; head injury or intracranial mass lesions; thyroid dysfunction; raised intra-ocular pressure; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see under Intravenous Anaesthetics; hypertension, pre-eclampsia or eclampsia,

severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

Hepatic impairment consider dose reduction

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding avoid for at least 12 hours after last dose

Side-effects see notes above; also nausea, vomiting; tachycardia, hypertension, arrhythmias, hypotension, bradycardia; hypersalivation, laryngospasm; anxiety, insomnia; diplopia, nystagmus, raised intra-ocular pressure; rash; apnoea and respiratory depression also reported

Dose

- By intramuscular injection, short procedures, initially 6.5–13 mg/kg, adjusted according to response (10 mg/kg usually produces 12–25 minutes of surgical anaesthesia)

  Diagnostic manoeuvres and procedures not involving intense pain, initially 4 mg/kg
- By intravenous injection over at least 60 seconds, short procedures, initially 1–4.5 mg/kg, adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia)
- By intravenous infusion of a solution containing 1 mg/mL, longer procedures, induction, total dose of 0.5–2 mg/kg; maintenance, 10–45 micrograms/kg/minute, rate adjusted according to response

Ketalar® (Pfizer) PoM

Injection, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10

Note For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% *or* Sodium Chloride 0.9% *or* Water for Injections

PROPOFOL

Indications see under Dose

Cautions see under Intravenous Anaesthetics and notes above; cardiac impairment; respiratory impairment; elderly; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia 6 mg/kg/hour

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also hypotension, tachycardia, flushing; transient apnoea, hyperventilation, coughing, and hiccup during induction; headache; *less commonly* thrombosis, phlebitis; *rarely* arrhythmia, headache, vertigo, shivering, euphoria; *very rarely* pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; serious and sometimes fatal side-effects reported with prolonged infusion of doses exceeding 5 mg/kg/hour, including metabolic acidosis, rhabdomyolysis, hyperkalaemia, and cardiac failure, dystonia and dyskinesia also reported

Dose

- Induction of anaesthesia using 0.5% *or* 1% injection, by intravenous injection *or* infusion, ADULT under 55 years and CHILD over 12 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–12 years, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)
- Induction of anaesthesia using 2% injection, by intravenous infusion, ADULT under 55 years and CHILD over 12 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 3–12 years, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)
- Maintenance of anaesthesia using 1% injection, by intravenous infusion, 4–12 mg/kg/hour (3–6 mg/kg/hour in ELDERLY or debilitated) *or* by intravenous injection, 25–50 mg repeated according to response; CHILD 1 month–12 years, by intravenous infusion, 9–15 mg/kg/hour
- Maintenance of anaesthesia using 2% injection, by intravenous infusion, 4–12 mg/kg/hour (3–6 mg/kg/hour in ELDERLY or debilitated); CHILD 3–12 years, by intravenous infusion, 9–15 mg/kg/hour
- Sedation of ventilated patients in intensive care using 1% *or* 2% injection, by intravenous infusion, ADULT and CHILD over 16 years, 0.3–4 mg/kg/hour
- Induction of sedation for surgical and diagnostic procedures using 0.5% *or* 1% injection, ADULT and CHILD over 12 years, initially by intravenous injection over 1–5 minutes, 0.5–1 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response; CHILD 1 month–12 years, 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response
- Induction of sedation for surgical and diagnostic procedures using 2% injection, ADULT and CHILD over 12 years, initially by intravenous infusion over 1–5 minutes, 0.5–1 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response
- Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration
- Maintenance of sedation for surgical and diagnostic procedures using 1% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–12 years, 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in response required, by intravenous injection, max. 1 mg/kg)

- Maintenance of sedation for surgical and diagnostic procedures using 2% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection using 0.5% *or* 1% injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 3–12 years, 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response

Propofol (Non-proprietary) PoM

0.5% injection (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46
Brands include *Propofol-Lipuro®*

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40
Brands include *Propofol-Lipuro®*, *Propoven®*

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30
Brands include *Propofol-Lipuro®*, *Propoven®*

Diprivan® (AstraZeneca) PoM

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £1.07, 50-mL prefilled syringe (for use with *Diprifusor® TCI* system) = £4.72

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with *Diprifusor® TCI* system) = £5.27

Note *Diprifusor® TCI* ('target controlled infusion') system is licensed **only** for induction and maintenance of general anaesthesia in **adults**

THIOPENTAL SODIUM
(Thiopentone sodium)

Indications induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2)

Cautions see notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above; acute porphyria (section 9.8.2); myotonic dystrophy

Hepatic impairment use with caution—reduce dose

Renal impairment caution in severe impairment

Pregnancy may depress neonatal respiration if used during delivery; dose should not exceed 250 mg

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, headache, sneezing, hypersensitivity reactions, rash

Dose

- Induction of general anaesthesia, by slow intravenous injection usually as a 2.5% (25 mg/mL) solution, ADULT over 18 years, fit and premedicated, initially 100–150 mg (reduced in elderly or debilitated) over 10–15 seconds (longer in elderly or debilitated), followed by further quantity if necessary according to response after 30–60 seconds; *or* up to 4 mg/kg (max. 500 mg); CHILD 1 month–18 years, initially up to 4 mg/kg, *then* 1 mg/kg repeated as necessary (max. total dose 7 mg/kg)
- Raised intracranial pressure, by slow intravenous injection, 1.5–3 mg/kg, repeated as required
- Status epilepticus (only if other measures fail, see section 4.8.2), by slow intravenous injection as a 2.5% (25 mg/mL) solution, ADULT over 18 years, 75–125 mg as a single dose; CHILD 1 month–18 years, initially up to 4 mg/kg by slow intravenous injection, *then* up to 8 mg/kg/hour by continuous intravenous infusion, adjusted according to response

Thiopental (Archimedes) PoM

Injection, powder for reconstitution, thiopental sodium, net price 500-mg vial = £3.68

15.1.2 Inhalational anaesthetics

Important
The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. They may be supplied via hospital pipelines or from metal cylinders (section 15.1). *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 781.

Anaesthesia and driving See section 15.1.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those sensitised to halogenated anaesthetics; halothane has been associated with *severe hepatotoxicity* (**important:** see below). In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics.

Isoflurane is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle

relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

Sevoflurane is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

Halothane is a volatile liquid anaesthetic that has largely been superseded by newer agents, but is occasionally used for inhalation induction of anaesthesia with careful monitoring for cardiorespiratory depression and arrhythmias. It is potent, induction is smooth, and the vapour is non-irritant and seldom induces coughing or breath-holding.

Halothane hepatotoxicity

Severe hepatotoxicity can follow halothane anaesthesia. It occurs more frequently after repeated exposure to halothane and has a high mortality. The risk of severe hepatotoxicity appears to be increased by repeated exposures within a short time interval, but even after a long interval (sometimes of several years), susceptible patients have been reported to develop jaundice. Since there is no reliable way of identifying patients at risk, the following precautions are recommended before the use of halothane:

- a careful anaesthetic history should be taken to determine previous exposure and previous reactions to halothane;
- repeated exposure to halothane within a period of **at least** 3 months should be **avoided** unless there are **overriding** clinical circumstances;
- a history of unexplained jaundice or pyrexia in a patient following exposure to halothane is an absolute **contra-indication** to its future use in that patient.

DESFLURANE

Indications see notes above

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Dose

- Induction of anaesthesia (but not recommended), by inhalation through specifically calibrated vaporiser, ADULT 4–11%
- Maintenance of anaesthesia, by inhalation through specifically calibrated vaporiser, ADULT 2–6% in nitrous oxide; 2.5–8.5% in oxygen or oxygen-enriched air; CHILD see *BNF for Children*

HALOTHANE

Indications see notes above

Cautions see notes above (**important**: see Halothane Hepatotoxicity, above); avoid for dental procedures in those under 18 years unless treated in hospital (high risk of arrhythmia); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment avoid if history of unexplained pyrexia or jaundice following previous exposure to halothane

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Dose

- Induction of anaesthesia, using specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, ADULT and CHILD over 1 month, initially 0.5% then increased gradually according to response to 2–4%
- Maintenance of anaesthesia, using specifically calibrated vaporiser, in oxygen, oxygen-air, or nitrous oxide-oxygen, ADULT and CHILD over 1 month, 0.5–2%

ISOFLURANE

Indications see notes above

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Dose

- Induction of anaesthesia, using specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, increased gradually from 0.5% to 3%
- Maintenance of anaesthesia, using specifically calibrated vaporiser, 1–2.5% in nitrous oxide-oxygen; an additional 0.5–1% may be required when given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide-oxygen

SEVOFLURANE

Indications see notes above

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also urinary retention, leucopenia, agitation in children; dystonia and seizures also reported

Dose

- Induction of anaesthesia, using a specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, adjusted according to response, ADULT and CHILD over 1 month initially 0.5–1% then increased gradually up to 8%
- Maintenance of anaesthesia, using a specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, adjusted according to response, ADULT and CHILD over 1 month 0.5–3%

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For *anaesthesia*, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For *analgesia* (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox®*, *Equanox®*) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in the presence of a pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B_{12}; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B_{12} concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor or vegetarian diet, and those with a history of anaemia. Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

NITROUS OXIDE

Indications see notes above

Cautions see notes above; **interactions:** Appendix 1 (anaesthetics, general)

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above

Dose

- Maintenance of anaesthesia in conjunction with other anaesthetic agents (using suitable anaesthetic apparatus), 50–66% in oxygen
- Analgesia, up to 50% in oxygen, according to the patient's needs

15.1.3 Antimuscarinic drugs

Important
The drugs in this section should be used by experienced personnel only.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as halothane, propofol, and suxamethonium.

Atropine sulphate is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

Hyoscine hydrobromide reduces secretions and also provides a degree of amnesia, sedation and anti-emesis. Unlike atropine it may produce bradycardia rather than tachycardia. In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

Glycopyrronium bromide reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

Phenothiazines do not effectively reduce secretions when used alone.

ATROPINE SULPHATE

Indications premedication; intra-operative bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular block; antidote to organophosphorous poisoning (see Emergency Treatment of Poisoning p. 41); symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm (section 1.2); bradycardia (section 2.3.1); cardiopulmonary resuscitation (section 2.7.3); cycloplegia, anterior uveitis (section 11.5)

Cautions section 1.2

Duration of action Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

Contra-indications section 1.2

Pregnancy not known to be harmful; use with caution

Breast-feeding small amount present in milk—use with caution

Side-effects section 1.2

Dose

- Premedication, by intravenous injection, 300–600 micrograms immediately before induction of anaesthesia; CHILD under 12 years see *BNF for Children*

  By subcutaneous or intramuscular injection, 300–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD under 12 years see *BNF for Children*
- Intra-operative bradycardia, by intravenous injection, 300–600 micrograms (larger doses in emergencies); CHILD under 12 years see *BNF for Children*
- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block, by intravenous injection, 0.6–1.2 mg; CHILD under 12 years, 20 micrograms/kg (max. 1.2 mg)
- Control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block [unlicensed indication], by intravenous injection, 600 micrograms; CHILD under 18 years see *BNF for Children*
- Arrhythmias after myocardial infarction, see section 2.3.1

[1] **Atropine** (Non-proprietary) PoM

Injection, atropine sulphate 600 micrograms/mL, net price 1-mL amp = 62p

Note Other strengths also available

Injection, prefilled disposable syringe, atropine sulphate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95

Injection, prefilled disposable syringe, atropine sulphate 200 micrograms/mL, net price 5 mL = £5.91; 300 micrograms/mL, 10 mL = £5.91; 600 micrograms/mL, 1 mL = £5.91

1. PoM restriction does not apply where administration is for saving life in emergency

[1] **Minijet® Atropine** (UCB Pharma) PoM

Injection, atropine sulphate 100 micrograms/mL, net price 5 mL = £5.04, 10 mL = £5.93, 30 mL = £9.85

1. PoM restriction does not apply where administration is for saving life in emergency

GLYCOPYRRONIUM BROMIDE
(Glycopyrrolate)

Indications drying secretions (see Prescribing in Palliative Care, p. 21); premedication; intra-operative bradycardia; *with neostigmine* for reversal of non-depolarising neuromuscular block; hyperhidrosis (section 13.12)

Cautions section 1.2

Contra-indications section 1.2

Side-effects section 1.2

Dose

- Premedication, by intramuscular *or* intravenous injection, 200–400 micrograms *or* 4–5 micrograms/kg (max. 400 micrograms); CHILD 1 month–12 years, 4–8 micrograms/kg (max. 200 micrograms)
- Intra-operative bradycardia, by intravenous injection, 200–400 micrograms *or* 4–5 micrograms/kg (max. 400 micrograms), repeated if necessary; CHILD 1 month–18 years, 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary
- Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, by intravenous injection, 200 micrograms per 1 mg of neostigmine, *or* 10–15 micrograms/kg; CHILD 1 month–12 years, 10 micrograms/kg (max. 500 micrograms)

Glycopyrronium bromide (Non-proprietary) PoM

Injection, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = 91p

With neostigmine metilsulphate

Section 15.1.6

HYOSCINE HYDROBROMIDE
(Scopolamine hydrobromide)

Indications premedication, motion sickness, hypersalivation associated with clozapine therapy (section 4.6); excessive respiratory secretions (see Prescribing in Palliative Care, p. 21)

Cautions see notes in section 1.2 and notes above; also epilepsy

Contra-indications see notes in section 1.2

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy use only if potential benefit outweighs risk; injection may depress neonatal respiration

Breast-feeding amount too small to be harmful

Side-effects see notes in section 1.2

Dose

- Premedication, by subcutaneous *or* intramuscular injection, 200–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD 15 micrograms/kg

Hyoscine (Non-proprietary) PoM

Injection, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.80; 600 micrograms/mL, 1-mL amp = £2.94

With papaveretum

Section 4.7.2

15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Anxiolytics
15.1.4.2 Non-opioid analgesics
15.1.4.3 Opioid analgesics

Important
The drugs in this section should be used by experienced personnel only.

Premedication These drugs are given to allay fear and anxiety in the pre-operative period (including the night before an operation), to relieve pain and discomfort when present, and to augment the action of subsequent

anaesthetic agents. A number of the drugs used also provide some degree of pre-operative amnesia. The choice will vary with the individual patient, the nature of the operative procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and recovery facilities. The choice also varies between elective and emergency operations.

Premedication in children Oral administration is preferred where possible; the rectal route should only be used in exceptional circumstances. For further details, consult *BNF for Children*.

Application of a local anaesthetic (section 15.2) to the injection site can help to prevent pain.

Dental procedures Anxiolytics diminish tension, anxiety and panic, and may benefit anxious patients. However, their use is no substitute for sympathy and reassurance.

Diazepam and temazepam are effective anxiolytics for dental treatment in adults, but they are less suitable for children. Diazepam has a longer duration of action than temazepam. When given at night diazepam is associated with more residual effects the following day; patients should be very carefully warned **not** to drive (**important**: for general advice on anaesthesia and driving see p. 776). For further information on hypnotics and anxiolytics, see section 4.1. For further information on hypnotics used for dental procedures, see section 4.1.1.

Anaesthesia and driving See section 15.1.

15.1.4.1 Anxiolytics

Anxiolytic benzodiazepines are widely used for premedication.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. They have no analgesic effect so an opioid analgesic may sometimes be required for pain.

Benzodiazepines can alleviate anxiety at doses that do not necessarily cause excessive sedation and they are of particular value during short procedures or during operations under local anaesthesia (including dentistry). Amnesia reduces the likelihood of any unpleasant memories of the procedure (although benzodiazepines, particularly when used for more profound sedation, can sometimes induce sexual fantasies). Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines. They are best avoided in myasthenia gravis, especially peri-operatively.

Diazepam is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not generally recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection. Diazepam is also available as a rectal solution but this preparation is not used for premedication or sedation.

Temazepam is given by mouth and has a shorter duration of action and a more rapid onset than diazepam given by mouth. It has been used as a premedicant in inpatient and day-case surgery; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam produces more prolonged sedation than temazepam and it has marked amnesic effects. It is used as a premedicant the night before major surgery; a further, smaller dose may be required the following morning if any delay in starting surgery is anticipated. Alternatively the first dose may be given early in the morning on the day of operation.

Midazolam is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Overdosage with midazolam

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.

DIAZEPAM

Indications premedication; conscious sedation for procedures, and in conjunction with local anaesthesia; short-term use in anxiety or insomnia, adjunct in acute alcohol withdrawal (section 4.1.2); status epilepticus (section 4.8.2); muscle spasms (section 10.2.2)

Cautions see notes above, section 4.1.2, and section 4.8.2; **interactions**: Appendix 1 (anxiolytics and hypnotics)

Contra-indications see notes above and section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2

Pregnancy see Benzodiazepines, section 4.1.2

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see notes above and section 4.1.2

Dose

- By mouth, 5–10 mg 1–2 hours before procedure (up to max. 20 mg for dental procedures carried out in hospital); ELDERLY (or debilitated), half adult dose
- By intravenous injection into a large vein (emulsion preparation preferred), sedative cover for minor surgical and medical procedures, ADULT over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg; CHILD under 18 years see *BNF for Children*
- By rectum, CHILD 1–18 years see *BNF for Children*

Preparations
Section 4.1.2

LORAZEPAM

Indications conscious sedation for procedures; premedication; short-term use in anxiety or insomnia (section 4.1.2); status epilepticus (section 4.8.2)

Cautions see notes above and section 4.1.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications see notes above and Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2

Pregnancy see Benzodiazepines, section 4.1.2

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see notes above and Diazepam, section 4.1.2

Dose

- By mouth, 2–3 mg the night before operation; 2–4 mg 1–2 hours before operation
- By slow intravenous injection, preferably diluted with an equal volume of sodium chloride intravenous infusion 0.9% or water for injections, 50 micrograms/kg 30–45 minutes before operation
- By intramuscular injection, diluted as above, 50 micrograms/kg 60–90 minutes before operation

Preparations
Section 4.1.2

MIDAZOLAM

Indications conscious sedation for procedures; sedation in intensive care; sedation in anaesthesia; premedication; induction of anaesthesia; status epilepticus (section 4.8.2)

Cautions see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; risk of severe hypotension in hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 1 mg/mL; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency

Hepatic impairment use with caution; can precipitate coma

Renal impairment start with small doses in severe impairment; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

Breast-feeding present in milk—avoid breast-feeding for 24 hours after administration

Side-effects see notes above; gastro-intestinal disturbances, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions

Dose

- Conscious sedation for procedures, by slow intravenous injection (approx. 2 mg/minute) 5–10 minutes before procedure, initially 2–2.5 mg (ELDERLY 0.5–1 mg), increased if necessary in steps of 1 mg (ELDERLY 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg), ELDERLY max. 3.5 mg; CHILD 1 month–18 years see *BNF for Children*

  By rectum, CHILD 6 months–18 years see *BNF for Children*

  By mouth, CHILD 1 month–18 years see *BNF for Children*

  By buccal administration, CHILD 6 months–18 years see *BNF for Children*
- Sedative in combined anaesthesia, by intravenous injection, 30–100 micrograms/kg repeated as required or by continuous intravenous infusion, 30–100 micrograms/kg/hour (ELDERLY lower doses needed); CHILD not recommended
- Premedication, by deep intramuscular injection, ADULT over 18 years, 70–100 micrograms/kg (ELDERLY or debilitated 25–50 micrograms/kg) 20–60 minutes before induction

  By intravenous injection, ADULT over 18 years, 1–2 mg 5–30 minutes before procedure, repeated as required (ELDERLY or debilitated 0.5 mg, repeat dose slowly as required)

  By rectum, CHILD 6 months–12 years see *BNF for Children*

  By mouth, CHILD 1 month–18 years see *BNF for Children*
- Induction (but rarely used), by slow intravenous injection, 150–200 micrograms/kg (ELDERLY or debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; CHILD 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)

- Sedation of patients receiving intensive care, by slow intravenous injection, initially 30–300 micrograms/kg given in steps of 1–2.5 mg every 2 minutes, then by slow intravenous injection *or* by continuous intravenous infusion, 30–200 micrograms/kg/hour; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia; lower doses may be adequate if opioid analgesic also used; CHILD under 12 years see *BNF for Children*

Midazolam (Non-proprietary) CD

Oral liquid, midazolam 2.5 mg/mL, 100 mL
Available from 'special-order' manufacturers or specialist importing companies, see p. 988

Injection, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = 50p, 5-mL amp = 60p, 50-mL vial = £7.87; 2 mg/mL, 5-mL amp = 65p; 5 mg/mL, 2-mL amp = 58p, 10-mL amp = £2.50

Hypnovel® (Roche) CD

Injection, midazolam (as hydrochloride) 2 mg/mL, net price 5-mL amp = 85p; 5 mg/mL, 2-mL amp = 72p

TEMAZEPAM

Indications premedication before surgery or investigatory procedures; hypnotic (section 4.1.1)

Cautions see notes above and Diazepam, section 4.1.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Contra-indications see notes above and Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.1

Renal impairment see Benzodiazepines, section 4.1.1

Pregnancy see Benzodiazepines, section 4.1.1

Breast-feeding see Benzodiazepines, section 4.1.1

Side-effects see notes above and Diazepam, section 4.1.2

Dose

- By mouth, premedication, ADULT, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; ELDERLY 10 mg (up to 20 mg in exceptional circumstances); CHILD 1 mg/kg (max. 30 mg)

Note Temazepam doses in BNF may differ from those in product literature

Preparations

Section 4.1.1

15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Acemetacin, **diclofenac**, **flurbiprofen**, **ibuprofen**, **ketoprofen**, (section 10.1.1), **paracetamol** (section 4.7.1), **parecoxib**, and **ketorolac** are licensed for postoperative use. Diclofenac, ketoprofen, ketorolac, and paracetamol can be given by injection as well as by mouth. Diclofenac can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Parecoxib (a selective inhibitor of cyclo-oxygenase-2) can be given by intramuscular or intravenous injection (but see also NSAIDs and Cardiovascular Events, section 10.1.1). The *Scottish Medicines Consortium* (p. 4) has advised (January 2003) that parecoxib is **not** recommended for use within NHS Scotland.

Suppositories of diclofenac and ketoprofen may be effective alternatives to the parenteral use of these drugs.

KETOROLAC TROMETAMOL

Indications short-term management of moderate to severe acute postoperative pain **only**

Cautions section 10.1.1; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypovolaemia or dehydration

Hepatic impairment section 10.1.1

Renal impairment max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

Pregnancy section 10.1.1

Breast-feeding amount too small to be harmful

Side-effects section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

Dose

- ADULT and CHILD over 16 years, by mouth, 10 mg every 4–6 hours (ELDERLY every 6–8 hours) as required; max. 40 mg daily; max. duration of treatment 7 days
- ADULT and CHILD over 16 years, by intramuscular injection *or* by intravenous injection over at least 15 seconds, initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (ELDERLY and patients weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days; CHILD 6 months–16 years see *BNF for Children*

Note When converting from parenteral to oral administration, total combined dose on the day of converting should not exceed 90 mg (60 mg in the elderly and patients weighing less than 50 kg) of which the oral component should not exceed 40 mg

Ketorolac (Non-proprietary) PoM

Injection, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.10

Toradol® (Roche) PoM

Tablets, ivory, f/c, ketorolac trometamol 10 mg, net price 20-tab pack = £5.45. Label: 17, 21

Injection, ketorolac trometamol 10 mg/mL, net price 1-mL amp = 89p; 30 mg/mL, 1-mL amp = £1.08

PARECOXIB

Indications short-term management of acute post-operative pain

Cautions section 10.1.1; dehydration; following coronary artery bypass graft surgery; **interactions:** Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also history of allergic drug reactions including sulphonamide hypersensitivity; inflammatory bowel disease

Hepatic impairment halve dose in moderate impairment (max. 40 mg daily); see also section 10.1.1

Renal impairment section 10.1.1

Pregnancy section 10.1.1

Breast-feeding avoid—present in milk in *animal* studies

Side-effects section 10.1.1; also flatulence, hypotension, hypoaesthesia, alveolar osteitis, postoperative anaemia, hypokalaemia, sweating; *less commonly* bradycardia, cardiovascular events, pulmonary embolism, anorexia, malaise, hyperglycaemia, increased blood urea nitrogen, arthralgia, ecchymosis; *rarely* tachycardia

Dose

- By deep intramuscular injection *or* by intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required for up to 3 days; max. 80 mg daily; ELDERLY weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; CHILD under 18 years, not recommended

Dynastat® (Pharmacia) ▼ PoM

Injection, powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67

15.1.4.3 Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

Intra-operative analgesia Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil, **fentanyl**, and **remifentanil** are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

ALFENTANIL

Indications analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days

Cautions section 4.7.2 and notes above

Contra-indications section 4.7.2

Hepatic impairment section 4.7.2

Renal impairment section 4.7.2

Pregnancy section 4.7.2

Breast-feeding present in milk— withhold breast-feeding for 24 hours

Side-effects section 4.7.2 and notes above; also hypertension, myoclonic movements; *less commonly* arrhythmias, hiccup, laryngospasm; *rarely* epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- By intravenous injection, spontaneous respiration, ADULT, initially up to 500 micrograms over 30 seconds; supplemental, 250 micrograms

  With assisted ventilation, ADULT over 18 years, initially 30–50 micrograms/kg; supplemental, 15 micrograms/kg; CHILD 1 month–18 years, initially 10–20 micrograms/kg; supplemental doses up to 10 micrograms/kg
- By intravenous infusion, with assisted ventilation, ADULT and CHILD, initially 50–100 micrograms/kg over 10 minutes *or* as a bolus, followed by maintenance of 0.5–1 micrograms/kg/minute

  Analgesia and suppression of respiratory activity during intensive care, with assisted ventilation, by intravenous infusion, initially 2 mg/hour subsequently adjusted according to response (usual range 0.5–10 mg/hour); more rapid initial control may be obtained with an intravenous dose of 5 mg given in divided portions over 10 minutes (slowing if hypotension or bradycardia occur); additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

Alfentanil (Non-proprietary) CD

Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20

Intensive care injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50

Note To be diluted before use

Rapifen® (Janssen-Cilag) CD

Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 64p; 10-mL amp = £2.90

Intensive care injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32

Note To be diluted before use

FENTANYL

Indications analgesia during operation, enhancement of anaesthesia; respiratory depressant in assisted respiration; analgesia in other situations (section 4.7.2)

Cautions see Fentanyl, section 4.7.2 and notes above

Contra-indications see notes in section 4.7.2

Hepatic impairment see notes in section 4.7.2

Renal impairment see notes in section 4.7.2

Pregnancy see notes in section 4.7.2

Breast-feeding see Fentanyl, section 4.7.2

Side-effects see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; *less commonly* laryngospasm; *rarely* asystole and insomnia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- By slow intravenous injection, with spontaneous respiration, ADULT and CHILD over 12 years, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required; CHILD 1 month–12 years see *BNF for Children*

  With assisted ventilation, ADULT and CHILD over 12 years, initially 0.3–3.5 mg, then 100–200 micrograms as required; CHILD 1 month–12 years see *BNF for Children*
- By intravenous infusion, with spontaneous respiration, ADULT, 3–4.8 micrograms/kg/hour adjusted according to response

  With assisted ventilation, ADULT, initially 10 micrograms/kg over 10 minutes then 6 micrograms/kg/hour adjusted according to response; may require up to 180 micrograms/kg/hour during cardiac surgery; CHILD 1 month–18 years see *BNF for Children*

Fentanyl (Non-proprietary) CD

Injection, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 64p

Sublimaze® (Janssen-Cilag) CD

Injection, fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

REMIFENTANIL

Indications supplementation of general anaesthesia during induction and analgesia during maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients

Cautions section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above

Contra-indications section 4.7.2 and notes above; left ventricular dysfunction; analgesia in conscious patients

Hepatic impairment section 4.7.2

Pregnancy no information available: see also section 4.7.2

Breast-feeding avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies

Side-effects section 4.7.2 and notes above; left ventricular dysfunction; analgesia in conscious patients; also hypertension; *less commonly* hypoxia; *rarely* asystole; AV block and convulsions also reported

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Induction of anaesthesia, ADULT and CHILD over 12 years, by intravenous infusion, 0.5–1 micrograms/kg/minute, *with or without* an initial dose by intravenous injection of 0.25–1 microgram/kg over at least 30 seconds

  Note If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary
- Maintenance of anaesthesia in ventilated patients, ADULT and CHILD over 12 years, by intravenous infusion, 0.05–2 micrograms/kg/minute (*with or without* an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds) according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses by intravenous injection every 2–5 minutes; CHILD 1–12 years, 0.05–1.3 micrograms/kg/minute (*with or without* an initial dose by intravenous injection of 0.1–1 microgram/kg over at least 30 seconds) according to anaesthetic technique and adjusted according to response
- Maintenance of anaesthesia with spontaneous respiration, ADULT and CHILD over 12 years, by intravenous infusion, initially 40 nanograms/kg/minute adjusted according to response, usual range 25–100 nanograms/kg/minute
- Analgesia and sedation in ventilated, intensive-care patients for max. 3 days, by intravenous infusion, ADULT over 18 years, initially 100–150 nanograms/kg/minute adjusted according to response in steps of 25 nanograms/kg/minute (allow at least 5 minutes between dose adjustments); usual range 6–740 nanograms/kg/minute; if an infusion rate of 200 nanograms/kg/minute does not produce adequate sedation add another sedative (consult product literature for details)
- Additional analgesia during stimulating or painful procedures in ventilated, intensive-care patients, by intravenous infusion, ADULT over 18 years, maintain infusion rate of at least 100 nanograms/kg/minute for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 250–750 nanograms/kg/minute
- Cardiac surgery, consult product literature

Note Remifentanil doses in BNF may differ from those in product literature

Ultiva® (GSK) CD

Injection, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

15.1.5 Neuromuscular blocking drugs

Important
The drugs in this section should be used by experienced personnel only.

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium, rocuronium, and vecuronium, and the **benzylisoquinolinium** group, comprising atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Cautions Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in patients with myasthenia gravis and in hypothermia, and lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response is unpredictable. Resistance can develop in patients with burns, who may require increased doses; low plasma cholinesterase activity in these patients requires dose titration for mivacurium. The rate of administration of neuromuscular blocking drugs should be reduced in patients with cardiovascular disease. **Interactions:** Appendix 1 (muscle relaxants).

Pregnancy Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

Breast-feeding Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Side-effects Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

Atracurium, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release.

Cisatracurium is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

ATRACURIUM BESILATE

(Atracurium besylate)

Indications neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; seizures also reported

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, ADULT and CHILD over 1 month, by intravenous injection, initially 300–600 micrograms/kg, then 100–200 micrograms/kg as required *or* initially by intravenous injection, 200–600 micrograms/kg followed by intravenous infusion, 300–600 micrograms/kg/hour
- Intensive care, ADULT and CHILD over 1 month, by intravenous injection, initially 300–600 micrograms/kg (optional) then by intravenous infusion 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour)

Atracurium (Non-proprietary) PoM

Injection, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.85; 5-mL amp = £3.37; 25-mL vial = £14.45

Tracrium® (GSK) PoM

Injection, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.66; 5-mL amp = £3.00; 25-mL vial = £12.91

CISATRACURIUM

Indications neuromuscular blockade (intermediate duration) for surgery or during intensive care

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also bradycardia

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, by intravenous injection, ADULT and CHILD over 1 month, initially 150 micrograms/kg; maintenance, by intravenous injection, ADULT and CHILD over 12 years, 30 micrograms/kg approx. every 20 minutes; CHILD 2–12 years, 20 micrograms/kg approx. every 10 minutes; *or* maintenance, by intravenous infusion, ADULT and CHILD over 2 years, initially 180 micrograms/kg/hour, *then after stabilisation*, 60–120 micrograms/kg/hour
  Note Lower doses can be used for children over 2 years when *not* for intubation
- Intensive care, ADULT initially 150 micrograms/kg (optional) by intravenous injection, then by intravenous infusion 180 micrograms/kg/hour adjusted according to response (usual range 30–600 micrograms/kg/hour)

Nimbex® (GSK) PoM

Injection, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

Forte injection, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

MIVACURIUM

Indications neuromuscular blockade (short duration) for surgery

Cautions see notes above; low plasma cholinesterase activity; elderly

Hepatic impairment reduce dose in severe impairment

Renal impairment clinical effect prolonged in renal failure—reduce dose according to response

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- By intravenous injection, 70–250 micrograms/kg; maintenance 100 micrograms/kg every 15 minutes; CHILD 2–6 months initially 150 micrograms/kg, 7 months–12 years initially 200 micrograms/kg; maintenance (CHILD 2 months–12 years) 100 micrograms/kg every 6–9 minutes
  Note Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In patients with asthma, cardiovascular disease or those who are sensitive to falls in arterial blood pressure give over 60 seconds
- By intravenous infusion after initial bolus intravenous dose, maintenance of block, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute; CHILD 2 months–12 years, usual dose 11–14 micrograms/kg/minute

Mivacron® (GSK) PoM

Injection, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

PANCURONIUM BROMIDE

Indications neuromuscular blockade (long duration) for surgery or during intensive care

Cautions see notes above

Hepatic impairment possibly slower onset, higher dose requirement, and prolonged recovery time

Renal impairment use with caution; prolonged duration of block

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, by intravenous injection, ADULT and CHILD over 1 month, initially 100 micrograms/kg then 20 micrograms/kg as required; NEONATE see *BNF for Children*
- Intensive care, by intravenous injection, initially 100 micrograms/kg (optional) then 60 micrograms/kg every 60–90 minutes

Pancuronium (Non-proprietary) PoM

Injection, pancuronium bromide 2 mg/mL, net price 2-mL amp = £1.20

ROCURONIUM BROMIDE

Indications neuromuscular blockade (intermediate duration) for surgery or during intensive care

Cautions see notes above

Hepatic impairment reduce dose

Renal impairment reduce maintenance dose; prolonged paralysis

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, ADULT and CHILD over 1 month, by intravenous injection, initially 600 micrograms/kg; maintenance by intravenous injection, 150 micrograms/kg (ELDERLY 75–100 micrograms/kg) *or* maintenance by intravenous infusion, 300–600 micrograms/kg/hour (ELDERLY up to 400 micrograms/kg/hour) adjusted according to response
- Intensive care, by intravenous injection, ADULT initially 600 micrograms/kg (optional); maintenance by intravenous infusion, 300–600 micrograms/kg/hour for first hour, then adjusted according to response

Rocuronium (Non-proprietary) PoM

Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

Esmeron® (Organon) PoM

Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.90, 10-mL vial = £5.79

VECURONIUM BROMIDE

Indications neuromuscular blockade (intermediate duration) for surgery

Cautions see notes above

Hepatic impairment use with caution in significant impairment

Renal impairment use with caution in renal failure

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- ADULT and CHILD over 1 month, by intravenous injection, 80–100 micrograms/kg; *then* maintenance, by intravenous injection *either* 20–30 micrograms/kg, adjusted according to response (max. 100 micrograms/kg in caesarian section), *or* by intravenous infusion, 0.8–1.4 micrograms/kg/minute, adjusted according to response; NEONATE see *BNF for Children*

Norcuron® (Organon) PoM

Injection, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.38 (with water for injections)

Depolarising neuromuscular blocking drugs

Suxamethonium has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block; edrophonium (section 15.1.6) may be used to confirm the diagnosis of dual block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

SUXAMETHONIUM CHLORIDE

(Succinylcholine chloride)

Indications neuromuscular blockade (short duration)

Cautions see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory, or neuromuscular disease; raised intraocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); **interactions:** Appendix 1 (muscle relaxants)

Contra-indications family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease, see Hepatic Impairment)

Hepatic impairment prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

Pregnancy mildly prolonged maternal neuromuscular blockade may occur

Breast-feeding unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

Side-effects see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinaemia; increased intraocular pressure; flushing, rash; *rarely* arrhythmias, cardiac arrest; bronchospasm, apnoea, prolonged

respiratory depression; limited jaw mobility; *very rarely* anaphylactic reactions, malignant hyperthermia; *also reported* hypertension, hypotension, rhabdomyolysis

Dose

- By intravenous injection, ADULT, 1–1.5 mg/kg; CHILD under 1 year, 2 mg/kg; CHILD 1–18 years, 1 mg/kg
- By intramuscular injection (onset in 2–3 minutes), CHILD 1 month–1 year, up to 4–5 mg/kg; CHILD 1–12 years, up to 4 mg/kg; max. 150 mg

Note Doses of suxamethonium in BNF may differ from those in product literature

Suxamethonium Chloride (Non-proprietary) PoM
Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 58p, 2-mL prefilled syringe = £8.45

Anectine® (GSK) PoM
Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

15.1.6 Drugs for reversal of neuromuscular blockade

Important
The drugs in this section should be used by experienced personnel only.

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

Edrophonium has a transient action and may be used in the diagnosis of suspected dual block due to suxamethonium. Atropine (section 15.1.3) is given before or with edrophonium to prevent muscarinic effects when given for reversal of non-depolarising neuromuscular blockade.

Neostigmine has a longer duration of action than edrophonium and is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

EDROPHONIUM CHLORIDE

Indications see under Dose; myasthenia gravis (section 10.2.1)
Cautions section 10.2.1; atropine should also be given
Contra-indications section 10.2.1
Pregnancy section 10.2.1
Breast-feeding section 10.2.1
Side-effects section 10.2.1
Dose

- Brief reversal of non-depolarising neuromuscular blockade, by intravenous injection over several minutes, 500–700 micrograms/kg (after or with atropine)
- Diagnosis of dual block, by intravenous injection, 10 mg

Edrophonium (Non-proprietary) PoM
Injection, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

NEOSTIGMINE METILSULFATE
(Neostigmine methylsulphate)

Indications see under Dose
Cautions section 10.2.1 and notes above; glycopyrronium or atropine should also be given
Contra-indications section 10.2.1 and notes above
Renal impairment section 10.2.1
Pregnancy section 10.2.1
Breast-feeding section 10.2.1
Side-effects section 10.2.1 and notes above
Dose

- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, ADULT over 18 years, 2.5 mg repeated if necessary (max. 5 mg) after or with glycopyrronium or atropine; CHILD under 18 years see *BNF for Children*
- Myasthenia gravis, see section 10.2.1

Neostigmine (Non-proprietary) PoM
Injection, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 58p

With glycopyrronium bromide

Glycopyrronium–Neostigmine (Non-proprietary) PoM
Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = 91p
Dose reversal of non-depolarising neuromuscular blockade, by intravenous injection over 10–30 seconds, 1–2 mL *or* 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); CHILD 0.02 mL/kg (*or* 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL)

Other drugs for reversal of neuromuscular blockade

Sugammadex is a modified gamma cyclodextrin used for reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5).

SUGAMMADEX

Indications reversal of neuromuscular blockade induced by rocuronium or vecuronium
Cautions recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours before re-administering rocuronium or vecuronium; **interactions**: Appendix 1 (sugammadex)
Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2
Pregnancy use with caution—no information available
Side-effects taste disturbances; *less commonly* allergic reactions; bronchospasm also reported

Dose

- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection, ADULT over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs
- Routine reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, CHILD 2–18 years, 2 mg/kg (consult product literature)
- Immediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, ADULT over 18 years, 16 mg/kg (consult product literature)

Bridion® (Schering-Plough) ▼ PoM

Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10

Electrolytes Na^+ 0.42 mmol/mL

15.1.7 Antagonists for central and respiratory depression

Important

The drugs in this section should be used by experienced personnel only.

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by **naloxone**. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram (section 3.5.1) is a central and respiratory stimulant but is of limited value in anaesthesia.

FLUMAZENIL

Indications reversal of sedative effects of benzodiazepines in anaesthetic, intensive care, and diagnostic procedures; overdosage with benzodiazepines (see Emergency Treatment of Poisoning)

Cautions short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours); benzodiazepine dependence (may precipitate withdrawal symptoms); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); history of panic disorders (risk of recurrence); ensure neuromuscular blockade cleared before giving; avoid rapid injection in high-risk or anxious patients and following major surgery; head injury (rapid reversal of benzodiazepine sedation may cause convulsions); elderly; children

Contra-indications life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

Hepatic impairment carefully titrate dose

Pregnancy may cross placenta in small amounts—avoid unless potential benefit outweighs risk

Breast-feeding avoid breast-feeding for 24 hours

Side-effects nausea, vomiting, and flushing; if wakening too rapid, agitation, anxiety, and fear; transient increase in blood pressure and heart-rate in intensive care patients; *very rarely* convulsions (particularly in those with epilepsy), hypersensitivity reactions including anaphylaxis

Dose

- By intravenous injection, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg (2 mg in intensive care); question aetiology if no response to repeated doses
- By intravenous infusion, if drowsiness recurs after injection, 100–400 micrograms/hour, adjusted according to level of arousal

Flumazenil (Non-proprietary) PoM

Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £14.49

Anexate® (Roche) PoM

Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.66

NALOXONE HYDROCHLORIDE

Indications see under Dose

Cautions cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); physical dependence on opioids (precipitates withdrawal); pain (see also under Titration of Dose, below); has short duration of action (repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action)

Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia

Pregnancy use only if potential benefit outweighs risk

Breast-feeding not orally bioavailable

Side-effects nausea, vomiting; hypotension, hypertension, ventricular tachycardia and fibrillation, cardiac arrest; hyperventilation, dyspnoea, pulmonary oedema; headache, dizziness; *less commonly* diarrhoea, dry mouth, agitation, excitement, paraesthesia, tremor, sweating; *very rarely* seizures, erythema multiforme, and hypersensitivity reactions including anaphylaxis

Dose

- Reversal of respiratory depression caused by medicinal use of opioids, ADULT and CHILD over 12 years, by intravenous injection, 100–200 micrograms (1.5–3 micrograms/kg); if response inadequate, give subsequent dose of 100 micrograms every 2 minutes; alternatively, subsequent doses can be given by intramuscular injection every 1–2 hours; CHILD 1 month–12 years see *BNF for Children*
- Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour, NEONATE, by intramuscular injection, 200 micrograms (60 micrograms/kg) as a single dose at birth; alternatively by subcutaneous *or* intravenous injection, 10 micrograms/kg, repeated every 2–3 minutes

- Opioid overdose, see Emergency Treatment of Poisoning, p. 36

Note Naloxone doses in BNF may differ from those in product literature

Preparations

See Emergency Treatment of Poisoning, p. 36

15.1.8 Drugs for malignant hyperthermia

Important
The drugs in this section should be used by experienced personnel only.

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

DANTROLENE SODIUM

Indications malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

Cautions avoid extravasation (risk of tissue necrosis); **interactions:** Appendix 1 (muscle relaxants)

Pregnancy use only if potential benefit outweighs risk

Breast-feeding present in milk— use only if potential benefit outweighs risk

Side-effects hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

Dose

- By rapid intravenous injection, ADULT, initially 2–3 mg/kg, then 1 mg/kg repeated as required to a cumulative max. of 10 mg/kg; CHILD 1 month–18 years see *BNF for Children*

Dantrium Intravenous® (SpePharm) PoM
Injection, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

15.2 Local anaesthesia

Important
The drugs in section 15.2 should be used by experienced personnel only and should not be administered parenterally unless adequate resuscitation equipment is available.

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

Use of local anaesthetics Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Administration The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so **careful surveillance** for toxic effects (see Toxicity and Side-effects, below) is necessary during the first 30 minutes after injection.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

Use of vasoconstrictors Local anaesthetics cause dilation of blood vessels. The addition of a vasoconstrictor such as **adrenaline** (**epinephrine**) to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is not advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, below). The total dose of adrenaline should **not** exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrena-

line, see section 2.7.3. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

Dental anaesthesia **Lidocaine** is widely used in dental procedures; it is most often used in combination with **adrenaline** (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, above.

The local anaesthetics **articaine** and **mepivacaine** are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine without adrenaline may be used. Alternatively, **prilocaine** with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Cautions of local anaesthetics Local anaesthetics should be administered with caution in children, elderly or debilitated patients (consider dose reduction), or in patients with impaired cardiac conduction, cardiovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

Contra-indications of local anaesthetics Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, above.

Local anaesthetic preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block).

Local anaesthetics can cause ototoxicity and should not be applied to the middle ear. They are also contra-indicated in patients with complete heart block.

Toxicity and side-effects A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by sedation, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, nausea and vomiting, muscle twitching, tremors, and convulsions. Transient excitation may also occur, followed by depression with drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur.

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics such as tetracaine; reactions are less frequent with the amide types such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

Articaine

Articaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, above). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 793).

ARTICAINE HYDROCHLORIDE WITH ADRENALINE

(Carticaine hydrochloride with adrenaline)

Indications infiltration anaesthesia in dentistry

Cautions see Cautions of Local Anaesthetics, above and Adrenaline, section 2.7.3

Contra-indications see Contra-indications of Local Anaesthetics, above and Adrenaline, section 2.7.3

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment see Adrenaline, section 2.7.3

Pregnancy use only if potential benefit outweighs risk—no information available

Breast-feeding avoid breast-feeding for 48 hours after administration

Side-effects see Toxicity and Side-effects, above and Adrenaline, section 2.7.3; also methaemoglobinaemia (see Prilocaine (p. 797) for treatment)

Dose

- ADULT and CHILD over 4 years, consult expert dental sources

Septanest® (Septodont) PoM

Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

Bupivacaine

Bupivacaine has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

BUPIVACAINE HYDROCHLORIDE

Indications see under Dose

Cautions see Cautions of Local Anaesthetics, above; myocardial depression may be more severe and more

resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral atheroma; **interactions:** Appendix 1 (bupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment caution in severe impairment

Renal impairment caution in severe impairment

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after paracervical or epidural block; use lower doses for intrathecal use during late pregnancy

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 794

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient's physical status and nature of procedure—**important**: see also under Administration, p. 793

- Local infiltration, max. 60 mL, using a 2.5 mg/mL (0.25%) solution
- Peripheral nerve block, max. 60 mL (150 mg), using a 2.5 mg/mL (0.25%) solution; max. 30 mL, using a 5 mg/mL (0.5%) solution
- Epidural block

  Surgery, *lumbar*, 10–20 mL (50–100 mg), using a 5 mg/mL (0.5%) solution

  Surgery, *caudal*, 15–30 mL (75–150 mg), using a 5 mg/mL (0.5%) solution; CHILD (up to 10 years) using a 2.5 mg/mL (0.25%) solution, up to lower-thoracic (T10) 0.3–0.4 mL/kg (0.75–1 mg/kg), up to mid-thoracic (T6) 0.4–0.8 mL/kg (1–2 mg/kg)

  Labour, *lumbar*, 6–12 mL (15–30 mg) using a 2.5 mg/mL (0.25%) or 6–12 mL (30–60 mg) using a 5 mg/mL (0.5%) solution
- Sympathetic block, 20–50 mL (50–125 mg), using a 2.5 mg/mL (0.25%) solution
- Intrathecal anaesthesia, see under preparations

Important
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Bupivacaine (Non-proprietary) PoM

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 82p; 5 mg/mL (0.5%), 10 mL = 94p

Infusion, anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £8.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

Dose continuous lumbar epidural infusion during labour (once epidural block established), 10–15 mg/hour of 0.1% or 0.125% solution; max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours

Continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–15 mg/hour of 0.1% solution, or 5–15 mg/hour of 0.125% solution; max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours; not recommended for use in children

Marcain® (AstraZeneca) PoM

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (*Marcain® 0.25%*), net price 10-mL *Polyamp®* = £1.06; 5 mg/mL (*Marcain® 0.5%*), 10-mL *Polyamp®* = £1.21

Marcain Heavy® (AstraZeneca) PoM

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.21

Dose intrathecal anaesthesia for surgery, 2–4 mL (10–20 mg bupivacaine); dose may need to be reduced in elderly and in late pregnancy

With adrenaline

For prescribing information on adrenaline, see section 2.7.3; see also Use of Vasoconstrictors, p. 793.

Bupivacaine and Adrenaline (Non-proprietary) PoM

Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

Injection, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.50

Levobupivacaine

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

LEVOBUPIVACAINE

Note Levobupivacaine is an isomer of bupivacaine

Indications see under Dose

Cautions see Cautions of Local Anaesthetics, p. 794; cardiovascular disease; **interactions:** Appendix 1 (levobupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment use with caution

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in the first trimester—toxicity in *animal* studies; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 794; also sweating, pyrexia, and anaemia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient's physical status and nature of procedure—**important**: see also under Administration, p. 793

- Surgical anaesthesia

  Lumbar epidural, 10–20 mL (50–150 mg) of 5 mg/mL or 7.5 mg/mL solution over 5 minutes; caesarean section, 15–30 mL (75–150 mg) of 5 mg/mL solution over 15–20 minutes

  Intrathecal, 3 mL (15 mg) of 5 mg/mL solution

  Peripheral nerve block, 1–40 mL of 2.5 mg/mL or 5 mg/mL solution (max. 150 mg); ilioinguinal/iliohypogastric block, CHILD under 12 years 0.25–0.5 mL/kg (0.625–2.5 mg/kg) of a 2.5 mg/mL or 5 mg/mL solution

  Peribulbar block, 5–15 mL (37.5–112.5 mg) of 7.5 mg/mL solution

  Local infiltration, 1–60 mL (max. 150 mg) of 2.5 mg/mL solution

- Acute pain

  Lumbar epidural, labour pain, 6–10 mL (15–25 mg) of 2.5 mg/mL solution at intervals of at least 15 minutes *or* 5–12.5 mg/hour as a continuous epidural infusion; postoperative pain, 12.5–18.75 mg/hour as a continuous epidural infusion; max. 400 mg in 24 hours

Important
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Chirocaine® (Abbott) PoM

Injection, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.42; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.43

Note For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%

Infusion, levobupivacaine (as hydrochloride) 625 micrograms/mL, net price 100 mL = £6.63, 200 mL = £10.37; 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

Lidocaine

Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

LIDOCAINE HYDROCHLORIDE
(Lignocaine hydrochloride)

Indications see under Dose; ventricular arrhythmias (section 2.3.2); eye (section 11.7)

Cautions See Cautions of Local Anaesthetics, p. 794 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes

Contra-indications see notes above, Contra-indications of Local Anaesthetics, p. 794, and section 2.3.2

Hepatic impairment section 2.3.2

Renal impairment section 2.3.2

Pregnancy large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block

Breast-feeding section 2.3.2

Side-effects see Toxicity and Side-effects, p. 794 and section 2.3.2; also methaemoglobinaemia (see under Prilocaine (p. 797) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- Infiltration anaesthesia, according to patient's weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—see also Administration on p. 793 and see also **important** warning below
- Intravenous regional anaesthesia and nerve blocks, seek expert advice
- Surface anaesthesia, see preparations below

Important
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Lidocaine hydrochloride injections

Lidocaine (Non-proprietary) PoM

Injection, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 35p; 10 mg/mL (1%), 2-mL amp = 25p, 5-mL amp = 26p, 10-mL amp = 39p, 10-mL prefilled syringe = £4.53; 20-mL amp = 75p; 20 mg/mL (2%), 2-mL amp = 32p, 5-mL amp = 31p

With adrenaline

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 793.

Xylocaine® (AstraZeneca) PoM

Injection, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = 99p

Injection, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.04

Lidocaine injections for dental use

A variety of lidocaine injections with adrenaline is available in dental cartridges; brands include *Lignospan Special®*, *Rexocaine®*, and *Xylocaine®*.

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 793.

Note Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

Lidocaine for surface anaesthesia

Instillagel® (CliniMed)

Gel, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = £1.41, 11-mL syringe = £1.58

Excipients include hydroxybenzoates (parabens)

Dose urethral sounding and catheterisation, 6–11 mL into urethra

Cystoscopy, 11 mL (a further instillation of 6–11 mL may be required)

Laryngojet® (UCB Pharma) PoM

Solution, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

Dose anaesthesia of oropharynx, trachea, or respiratory tract, 40–200 mg (1–5 mL) as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient), usual dose 160 mg (4 mL); CHILD up to 3 mg/kg

LMX 4® (Ferndale)

Cream lidocaine 4%, net price 5-g tube = £2.98; 5 × 5-g tube with 10 occlusive dressings = £16.90

Excipients include benzyl alcohol and propylene glycol

Dose ADULT and CHILD over 1 month, anaesthesia before venous cannulation or venepuncture, apply thick layer (1–2.5 g; CHILD under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non–irritated skin at least 30 minutes before procedure (max. 60 minutes); remove cream with gauze and perform procedure after approximately 5 minutes

Versatis® (Grünenthal) PoM

Plasters, lidocaine 5% (700 mg/medicated plaster), net price 30 = £72.40

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose postherpetic neuralgia, ADULT over 18 years, apply to intact, dry, non-hairy, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks

Note Up to 3 plasters may be used to cover large areas; plasters may be cut

Note The *Scottish Medicines Consortium* (p. 4) has advised (July 2008) that *Versatis®* is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective

Xylocaine® (AstraZeneca)

Spray, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £3.13

Dose dental practice, 1–5 doses

Maxillary sinus puncture, 3 doses

During delivery in obstetrics, up to 20 doses

Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation, up to 20 doses; CHILD up to 3 mg/kg

With prilocaine

For prescribing information on prilocaine, see below

EMLA® (AstraZeneca)

Cream, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £1.73; 30-g tube (surgical pack) = £10.25; 5 × 5-g tube with 12 occlusive dressings (premedication pack) = £9.75

Dose ADULT and CHILD over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for CHILD 1–12 years; CHILD under 3 months or body-weight less than 5 kg, apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours, CHILD 3–12 months and body-weight over 5 kg, apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

Note Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis

Anaesthesia on genital skin before injection of local anaesthetics in adult men, apply under occlusive dressing for 15 minutes

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Lidocaine for ear, nose, and oropharyngeal use

For prescribing information on phenylephrine, see section 2.7.2

Lidocaine with phenylephrine (Non-proprietary)

Topical solution, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £9.98

Dose anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose, ADULT and CHILD over 12 years, up to max. 8 sprays

Mepivacaine

Mepivacaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 794).

MEPIVACAINE HYDROCHLORIDE

Indications infiltration anaesthesia and nerve block in dentistry

Cautions see Cautions of Local Anaesthetics, p. 794

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment use with caution; increased risk of side-effects

Pregnancy use with caution in early pregnancy

Breast-feeding use with caution

Side-effects see Toxicity and Side-effects, p. 794

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- Consult expert dental sources

Scandonest® 3% Plain (Septodont) PoM

Injection, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

With adrenaline

For prescribing information on adrenaline, see section 2.7.3: see also Use of Vasoconstrictors, p. 793.

Scandonest® 2% Special (Septodont) PoM

Injection, mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36p

Prilocaine

Prilocaine is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinaemia may occur which can be treated with an intravenous injection of **methylthioninium chloride** 1% using a dose of 1–2 mg/kg given over 5 minutes. The dose may be repeated after 30–60 minutes if no response. Infants under 6 months are particularly susceptible to methaemoglobinaemia. A hyperbaric solution of prilocaine (containing glucose) may be used for spinal anaesthesia.

PRILOCAINE HYDROCHLORIDE

Indications see under preparations

Cautions see Cautions of Local Anaesthetics, p. 794; severe or untreated hypertension; concomitant use of drugs that cause methaemoglobinaemia; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (prilocaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794; anaemia or congenital or acquired methaemoglobinaemia

Hepatic impairment use with caution; lower doses may be required for intrathecal anaesthesia

Renal impairment use with caution; lower doses may be required for intrathecal anaesthesia

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and

bradycardia after epidural block; avoid paracervical or pudenal block in obstetrics (neonatal methaemoglobinaemia reported); use lower doses for intrathecal use during late pregnancy

Breast-feeding present in milk but not known to be harmful

Side-effects see notes above and Toxicity and Side-effects, p. 794; also hypertension

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- See under preparations—**important:** see also Administration, p. 793

Citanest 1%® (AstraZeneca) PoM

Injection, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £2.01

Dose infiltration anaesthesia and nerve block, adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (dose may need to be adjusted in ELDERLY or debilitated patients); CHILD over 6 months up to 5 mg/kg

Prilotekal® (Goldshield) PoM

Injection, prilocaine hydrochloride 20 mg/mL (2%), glucose 60 mg/mL, net price 5-mL amp = £7.80

Dose intrathecal anaesthesia, ADULT over 18 years, usually 40–60 mg, max. 80 mg (dose may need to be reduced in ELDERLY or debilitated patients, or in late pregnancy)

With lidocaine

See Lidocaine, p. 797

For dental use

Note Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

Citanest 4%® (Dentsply) PoM

Injection, prilocaine hydrochloride 40 mg/mL, net price 2.2-mL cartridge = 17p

Citanest 3% with Octapressin® (Dentsply) PoM

Injection, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

Ropivacaine

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

ROPIVACAINE HYDROCHLORIDE

Indications see under Dose

Cautions see Cautions of Local Anaesthetics, p. 794; also acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ropivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment use with caution in severe impairment

Renal impairment caution in severe impairment; increased risk of systemic toxicity in chronic renal failure

Pregnancy not known to be harmful; do not use for paracervical block in obstetrics

Breast-feeding not known to be harmful

Side-effects see Toxicity and Side-effects, p. 794; also hypertension, pyrexia; *less commonly* syncope, and hypothermia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient's physical status and nature of procedure—**important** see also under Administration, p. 793

- Surgical anaesthesia

  Lumbar epidural, ADULT and CHILD over 12 years, 15–20 mL (150–200 mg) of 10 mg/mL solution *or* 15–25 mL (113–188 mg) of 7.5 mg/mL solution; caesarean section, 15–20 mL (113–150 mg) of 7.5 mg/mL solution in incremental doses

  Thoracic epidural (to establish block for postoperative pain), ADULT and CHILD over 12 years, 5–15 mL (38–113 mg) of 7.5 mg/mL solution

  Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 30–40 mL (225–300 mg) of 7.5 mg/mL solution

  Field block, ADULT and CHILD over 12 years, 1–30 mL (7.5–225 mg) of 7.5 mg/mL solution

- Acute pain using 2 mg/mL solution

  Lumbar epidural, ADULT and CHILD over 12 years, 10–20 mL (20–40 mg) followed by 10–15 mL (20–30 mg) at intervals of at least 30 minutes *or* 6–10 mL/hour (12–20 mg/hour) as a continuous epidural infusion for labour pain *or* 6–14 mL/hour (12–28 mg/hour) as a continuous epidural infusion for postoperative pain

  Thoracic epidural, ADULT and CHILD over 12 years, 6–14 mL/hour (12–28 mg/hour) as a continuous infusion

  Field block, ADULT and CHILD over 12 years, 1–100 mL (2–200 mg)

  Peripheral nerve block, ADULT and CHILD over 12 years, 5–10 mL/hour (10–20 mg/hour) as a continuous infusion *or* by intermittent injection

  CHILD under 12 years, consult product literature

Ropivacaine (Non-proprietary) PoM

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £14.45

Naropin® (AstraZeneca) PoM

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10-mL *Polyamp®* = £1.78; 7.5 mg/mL, 10-mL *Polyamp®* = £2.65; 10 mg/mL, 10-mL *Polyamp®* = £3.20

Electrolytes Na^+ <0.5 mmol/mL

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200-mL *Polybag®* = £14.45

Electrolytes Na^+ <0.5 mmol/mL

Tetracaine

Tetracaine is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.

TETRACAINE
(Amethocaine)

Indications see under preparation; eye (section 11.7)

Cautions see Cautions of Local Anaesthetics, p. 794

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Breast-feeding not known to be harmful

Side-effects see Toxicity and Side-effects, p. 794

Important Rapid and extensive absorption may result in systemic side-effects (see also notes above)

Ametop® (S&N Hlth.)

Gel, tetracaine 4%, net price 1.5-g tube = £1.08

Dose ADULT and CHILD over 1 month, apply contents of tube to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation; NEONATE see *BNF for Children*

Note ADULT and CHILD over 5 years, contents of max. 5 tubes applied at separate sites at a single time; CHILD 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time

A1 Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

Serious interactions The symbol ● has been placed against interactions that are **potentially serious** and where combined administration of the drugs involved should be **avoided** (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts; changes in the interactions lists since BNF No. 60 (September 2010) are underlined.

For explanation of symbol ● see above

Abacavir

Analgesics: abacavir possibly reduces plasma concentration of methadone

Antibacterials: plasma concentration of abacavir possibly reduced by rifampicin

Antiepileptics: plasma concentration of abacavir possibly reduced by phenytoin

● Antivirals: abacavir possibly reduces effects of ●ribavirin; plasma concentration of abacavir reduced by ●tipranavir

Barbiturates: plasma concentration of abacavir possibly reduced by phenobarbital

Abatacept

Adalimumab: increased risk of side-effects when abatacept given with adalimumab

● Certolizumab pegol: avoid concomitant use of abatacept with ●certolizumab pegol

● Etanercept: avoid concomitant use of abatacept with ●etanercept

● Golimumab: avoid concomitant use of abatacept with ●golimumab

● Infliximab: avoid concomitant use of abatacept with ●infliximab

● Vaccines: avoid concomitant use of abatacept with live ●vaccines (see p. 746)

Acarbose *see* Antidiabetics

ACE Inhibitors

Alcohol: enhanced hypotensive effect when ACE inhibitors given with alcohol

Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with aldesleukin

Allopurinol: increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with allopurinol especially in renal impairment

Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with general anaesthetics

Analgesics: increased risk of renal impairment when ACE inhibitors given with NSAIDs, also hypotensive effect antagonised

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with angiotensin-II receptor antagonists

Antacids: absorption of ACE inhibitors possibly reduced by antacids; absorption of captopril, enalapril and fosinopril reduced by antacids

Antibacterials: plasma concentration of active metabolite of imidapril reduced by rifampicin (reduced antihypertensive effect); quinapril tablets reduce absorption of tetracyclines (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with trimethoprim

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with heparins

Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs

Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of insulin, metformin and sulfonylureas

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with antipsychotics

Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with anxiolytics and hypnotics

Azathioprine: increased risk of anaemia or leucopenia when captopril given with azathioprine especially in

ACE Inhibitors *(continued)*

Azathioprine *(continued)*
renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers

Cardiac Glycosides: captopril possibly increases plasma concentration of digoxin

● Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ●ciclosporin

Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine; antihypertensive effect of captopril possibly delayed by previous treatment with clonidine

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide

● Diuretics: enhanced hypotensive effect when ACE inhibitors given with ●diuretics; increased risk of severe hyperkalaemia when ACE inhibitors given with ●potassium-sparing diuretics and aldosterone antagonists (monitor potassium concentration with low-dose spironolactone in heart failure)

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with levodopa

● Lithium: ACE inhibitors reduce excretion of ●lithium (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when ACE inhibitors given with methyldopa

Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with moxisylyte

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when ACE inhibitors given with nitrates

Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens

● Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with ●potassium salts

Probenecid: excretion of captopril reduced by probenecid

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with alprostadil

● Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with ●sodium aurothiomalate

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with hydralazine, minoxidil or sodium nitroprusside

Acebutolol *see* Beta-blockers

Aceclofenac *see* NSAIDs

Acemetacin *see* NSAIDs

Acenocoumarol *see* Coumarins

Acetazolamide *see* Diuretics

Aciclovir

Note Interactions do not apply to topical aciclovir preparations

Note Valaciclovir interactions as for aciclovir

Ciclosporin: increased risk of nephrotoxicity when aciclovir given with ciclosporin

Mycophenolate: plasma concentration of aciclovir increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate increased

Probenecid: excretion of aciclovir reduced by probenecid (increased plasma concentration)

Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with tacrolimus

Theophylline: aciclovir possibly increases plasma concentration of theophylline

Acitretin *see* Retinoids

Acrivastine *see* Antihistamines

Adalimumab

Abatacept: increased risk of side-effects when adalimumab given with abatacept

- Anakinra: avoid concomitant use of adalimumab with •anakinra
- Vaccines: avoid concomitant use of adalimumab with live •vaccines (see p. 746)

Adefovir

Antivirals: avoidance of adefovir advised by manufacturer of tenofovir

Adenosine

Note Possibility of interaction with drugs tending to impair myocardial conduction

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with •beta-blockers
- Dipyridamole: effect of adenosine enhanced and extended by •dipyridamole (important risk of toxicity)

Nicotine: effects of adenosine possibly enhanced by nicotine

Theophylline: anti-arrhythmic effect of adenosine antagonised by theophylline

Adrenaline (epinephrine) *see* Sympathomimetics

Adrenergic Neurone Blockers

Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with alcohol

Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers

- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with •general anaesthetics

Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIs; hypotensive effect of adrenergic neurone blockers antagonised by tricyclics

Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by haloperidol; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of chlorpromazine; enhanced hypotensive effect when adrenergic neurone blockers given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with clonidine

Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with diazoxide

Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with diuretics

Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with levodopa

Adrenergic Neurone Blockers *(continued)*

Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with methyldopa

Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with moxisylyte

Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with nitrates

Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by oestrogens

Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by pizotifen

Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with alprostadil

- Sympathomimetics: hypotensive effect of guanethidine antagonised by •dexamfetamine; hypotensive effect of adrenergic neurone blockers antagonised by •ephedrine, •isometheptene, •metaraminol, •methylphenidate, •noradrenaline (norepinephrine), •oxymetazoline, •phenylephrine, •pseudoephedrine and •xylometazoline

Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with hydralazine, minoxidil or sodium nitroprusside

Adsorbents *see* Kaolin

Agalsidase Alfa and Beta

Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by amiodarone (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antibacterials: effects of agalsidase alfa and beta possibly inhibited by gentamicin (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antimalarials: effects of agalsidase alfa and beta possibly inhibited by chloroquine and hydroxychloroquine (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Agomelatine

- Antibacterials: manufacturer of agomelatine advises avoid concomitant use with •ciprofloxacin
- Antidepressants: metabolism of agomelatine inhibited by •fluvoxamine (increased plasma concentration)
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

Alcohol

ACE Inhibitors: enhanced hypotensive effect when alcohol given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with adrenergic neurone blockers

Alpha-blockers: increased sedative effect when alcohol given with indoramin; enhanced hypotensive effect when alcohol given with alpha-blockers

Analgesics: enhanced hypotensive and sedative effects when alcohol given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with angiotensin-II receptor antagonists

- Antibacterials: disulfiram-like reaction when alcohol given with metronidazole; possibility of disulfiram-like reaction when alcohol given with tinidazole; increased risk of convulsions when alcohol given with •cycloserine
- Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with •coumarins or •phenindione
- Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with •MAOIs (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with

Alcohol

- Antidepressants *(continued)*
  SSRIs; increased sedative effect when alcohol given with •mirtazapine, •tricyclic-related antidepressants or •tricyclics
  Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin
  Antiepileptics: alcohol possibly increases CNS side-effects of carbamazepine; chronic heavy consumption of alcohol possibly reduces plasma concentration of phenytoin; increased sedative effect when alcohol given with primidone
  Antifungals: effects of alcohol possibly enhanced by griseofulvin
  Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines)
  Antimuscarinics: increased sedative effect when alcohol given with hyoscine
  Antipsychotics: increased sedative effect when alcohol given with antipsychotics
  Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics
  Barbiturates: increased sedative effect when alcohol given with barbiturates
  Beta-blockers: enhanced hypotensive effect when alcohol given with beta-blockers
  Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil
  Clonidine: enhanced hypotensive effect when alcohol given with clonidine
  Cytotoxics: disulfiram-like reaction when alcohol given with procarbazine
  Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide
  Disulfiram: disulfiram reaction when alcohol given with disulfiram (see p. 310)
  Diuretics: enhanced hypotensive effect when alcohol given with diuretics
  Dopaminergics: alcohol reduces tolerance to bromocriptine
  Levamisole: possibility of disulfiram-like reaction when alcohol given with levamisole
  Lofexidine: increased sedative effect when alcohol given with lofexidine
  Methyldopa: enhanced hypotensive effect when alcohol given with methyldopa
  Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine
  Muscle Relaxants: increased sedative effect when alcohol given with baclofen, methocarbamol or tizanidine
  Nabilone: increased sedative effect when alcohol given with nabilone
  Nicorandil: alcohol possibly enhances hypotensive effect of nicorandil
  Nitrates: enhanced hypotensive effect when alcohol given with nitrates
- Paraldehyde: increased sedative effect when alcohol given with •paraldehyde
- Retinoids: presence of alcohol causes etretinate to be formed from •acitretin (increased risk of teratogenecity in women of child-bearing potential)
  Sympathomimetics: alcohol possibly enhances effects of methylphenidate
  Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with hydralazine, minoxidil or sodium nitroprusside

Aldesleukin

ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with ACE inhibitors
Alpha-blockers: enhanced hypotensive effect when aldesleukin given with alpha-blockers

Aldesleukin *(continued)*

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with angiotensin-II receptor antagonists
Antivirals: aldesleukin possibly increases plasma concentration of indinavir
Beta-blockers: enhanced hypotensive effect when aldesleukin given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when aldesleukin given with clonidine

- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with •corticosteroids
- Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with •cisplatin, •dacarbazine and •vinblastine

Diazoxide: enhanced hypotensive effect when aldesleukin given with diazoxide
Diuretics: enhanced hypotensive effect when aldesleukin given with diuretics
Methyldopa: enhanced hypotensive effect when aldesleukin given with methyldopa
Moxonidine: enhanced hypotensive effect when aldesleukin given with moxonidine
Nitrates: enhanced hypotensive effect when aldesleukin given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with hydralazine, minoxidil or sodium nitroprusside

Alendronic Acid *see* Bisphosphonates

Alfentanil *see* Opioid Analgesics

Alfuzosin *see* Alpha-blockers

Alimemazine *see* Antihistamines

Aliskiren

Analgesics: hypotensive effect of aliskiren possibly antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: plasma concentration of aliskiren possibly reduced by irbesartan
Anticoagulants: increased risk of hyperkalaemia when aliskiren given with heparins
Antifungals: plasma concentration of aliskiren increased by ketoconazole
Calcium-channel Blockers: manufacturer of aliskiren advises avoid concomitant use with verapamil

- Ciclosporin: plasma concentration of aliskiren increased by •ciclosporin—avoid concomitant use

Diuretics: aliskiren reduces plasma concentration of furosemide; increased risk of hyperkalaemia when aliskiren given with potassium-sparing diuretics and aldosterone antagonists
Potassium Salts: increased risk of hyperkalaemia when aliskiren given with potassium salts

Alitretinoin *see* Retinoids

Alkylating Drugs *see* Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepa

Allopurinol

ACE Inhibitors: increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE inhibitors especially in renal impairment
Antibacterials: increased risk of rash when allopurinol given with amoxicillin or ampicillin
Anticoagulants: allopurinol possibly enhances anticoagulant effect of coumarins

- Antivirals: allopurinol increases plasma concentration of •didanosine (risk of toxicity)—avoid concomitant use
- Azathioprine: allopurinol enhances effects and increases toxicity of •azathioprine (reduce dose of azathioprine to one quarter of usual dose)

Ciclosporin: allopurinol possibly increases plasma concentration of ciclosporin (risk of nephrotoxicity)

- Cytotoxics: allopurinol enhances effects and increases toxicity of •mercaptopurine (reduce dose of mercaptopurine to one quarter of usual dose);

Allopurinol

- Cytotoxics *(continued)*
  avoidance of allopurinol advised by manufacturer of •capecitabine

Diuretics: increased risk of hypersensitivity when allopurinol given with thiazides and related diuretics especially in renal impairment

Theophylline: allopurinol possibly increases plasma concentration of theophylline

Almotriptan *see* $5HT_1$ Agonists

Alpha$_2$-adrenoceptor Stimulants *see* Apraclonidine, Brimonidine, Clonidine and Methyldopa

Alpha-blockers

ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when alpha-blockers given with alcohol; increased sedative effect when indoramin given with alcohol

Aldesleukin: enhanced hypotensive effect when alpha-blockers given with aldesleukin

- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with •general anaesthetics

Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with angiotensin-II receptor antagonists

- Antidepressants: enhanced hypotensive effect when alpha-blockers given with MAOIs; manufacturer of indoramin advises avoid concomitant use with •MAOIs

Antifungals: plasma concentration of alfuzosin possibly increased by ketoconazole

Antipsychotics: enhanced hypotensive effect when alpha-blockers given with antipsychotics

- Antivirals: plasma concentration of alfuzosin possibly increased by •ritonavir—avoid concomitant use

Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with anxiolytics and hypnotics

- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with •beta-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with •calcium-channel blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Cardiac Glycosides: prazosin increases plasma concentration of digoxin

Clonidine: enhanced hypotensive effect when alpha-blockers given with clonidine

Corticosteroids: hypotensive effect of alpha-blockers antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when alpha-blockers given with diazoxide

- Diuretics: enhanced hypotensive effect when alpha-blockers given with •diuretics, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Dopaminergics: enhanced hypotensive effect when alpha-blockers given with levodopa

Methyldopa: enhanced hypotensive effect when alpha-blockers given with methyldopa

- Moxisylyte: possible severe postural hypotension when alpha-blockers given with •moxisylyte

Moxonidine: enhanced hypotensive effect when alpha-blockers given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when alpha-blockers given with nitrates

Alpha-blockers *(continued)*

Oestrogens: hypotensive effect of alpha-blockers antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when alpha-blockers given with alprostadil

- Sildenafil: enhanced hypotensive effect when alpha-blockers given with •sildenafil (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 515
- Sympathomimetics: avoid concomitant use of tolazoline with •adrenaline (epinephrine) or •dopamine
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with •tadalafil—see also p. 515; enhanced hypotensive effect when doxazosin given with •tadalafil—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tolazoline antagonised by •cimetidine and •ranitidine
- Vardenafil: enhanced hypotensive effect when alpha-blockers (excludes tamsulosin) given with •vardenafil—separate doses by 6 hours—see also p. 515

Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with hydralazine, minoxidil or sodium nitroprusside

Alpha-blockers (post-synaptic) *see* Alpha-blockers

Alprazolam *see* Anxiolytics and Hypnotics

Alprostadil *see* Prostaglandins

Aluminium Hydroxide *see* Antacids

Amantadine

Antimalarials: plasma concentration of amantadine possibly increased by quinine

Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with antipsychotics

Bupropion: increased risk of side-effects when amantadine given with bupropion

- Memantine: increased risk of CNS toxicity when amantadine given with •memantine (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by memantine

Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa

Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with tetrabenazine

Amikacin *see* Aminoglycosides

Amiloride *see* Diuretics

Aminoglycosides

Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by indometacin

- Antibacterials: neomycin reduces absorption of phenoxymethylpenicillin; increased risk of nephrotoxicity when aminoglycosides given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with capreomycin or •vancomycin; possible increased risk of nephrotoxicity when aminoglycosides given with cephalosporins
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with •coumarins or •phenindione

Antidiabetics: neomycin possibly enhances hypoglycaemic effect of acarbose, also severity of gastrointestinal effects increased

Antifungals: increased risk of nephrotoxicity when aminoglycosides given with amphotericin

Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with bisphosphonates

Cardiac Glycosides: neomycin reduces absorption of digoxin; gentamicin possibly increases plasma concentration of digoxin

Aminoglycosides *(continued)*

- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with •ciclosporin
- Cytotoxics: neomycin possibly reduces absorption of methotrexate; neomycin reduces bioavailability of sorafenib; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with •platinum compounds
- Diuretics: increased risk of ototoxicity when aminoglycosides given with •loop diuretics
- Muscle Relaxants: aminoglycosides enhance effects of •non-depolarising muscle relaxants and •suxamethonium
- Parasympathomimetics: aminoglycosides antagonise effects of •neostigmine and •pyridostigmine
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with •tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Vitamins: neomycin possibly reduces absorption of vitamin A

Aminophylline *see* Theophylline

Aminosalicylates

Azathioprine: possible increased risk of leucopenia when aminosalicylates given with azathioprine

Cardiac Glycosides: sulfasalazine possibly reduces absorption of digoxin

Cytotoxics: possible increased risk of leucopenia when aminosalicylates given with mercaptopurine

Folates: sulfasalazine possibly reduces absorption of folic acid

Amiodarone

Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with •disopyramide or •dronedarone—avoid concomitant use; amiodarone increases plasma concentration of •flecainide (halve dose of flecainide)
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with *parenteral* •erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with •levofloxacin or •moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with •sulfamethoxazole and •trimethoprim (as co-trimoxazole)—avoid concomitant use of co-trimoxazole
- Anticoagulants: amiodarone inhibits metabolism of •coumarins and •phenindione (enhanced anticoagulant effect); amiodarone increases plasma concentration of •dabigatran etexilate (reduce dose of dabigatran etexilate)
- Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with •tricyclics—avoid concomitant use
- Antiepileptics: amiodarone inhibits metabolism of •phenytoin (increased plasma concentration)
- Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of amiodarone advised by manufacturer of •artemether/lumefantrine (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with •chloroquine and hydroxychloroquine, •mefloquine or •quinine—avoid concomitant use

Amiodarone *(continued)*

- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with •benperidol—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with •amisulpride, •droperidol, •haloperidol, •phenothiazines, •pimozide or •zuclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with •sulpiride
- Antivirals: plasma concentration of amiodarone possibly increased by •atazanavir; plasma concentration of amiodarone possibly increased by •fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by •indinavir—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with •nelfinavir or •saquinavir—avoid concomitant use; plasma concentration of amiodarone increased by •ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use)
- Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with •atomoxetine
- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with •beta-blockers; increased myocardial depression when anti-arrhythmics given with •beta-blockers; increased risk of ventricular arrhythmias when amiodarone given with •sotalol—avoid concomitant use
- Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with •diltiazem or •verapamil
- Cardiac Glycosides: amiodarone increases plasma concentration of •digoxin (halve dose of digoxin)

Ciclosporin: amiodarone possibly increases plasma concentration of ciclosporin

- Colchicine: amiodarone possibly increases risk of •colchicine toxicity
- Cytotoxics: increased risk of ventricular arrhythmias when amiodarone given with •arsenic trioxide

Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; amiodarone increases plasma concentration of eplerenone (reduce dose of eplerenone)

Grapefruit Juice: plasma concentration of amiodarone increased by grapefruit juice

- Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with •ivabradine
- Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with •simvastatin
- Lithium: manufacturer of amiodarone advises avoid concomitant use with •lithium (risk of ventricular arrhythmias)

Orlistat: plasma concentration of amiodarone possibly reduced by orlistat

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with •pentamidine isetionate—avoid concomitant use

Thyroid Hormones: for concomitant use of amiodarone and thyroid hormones see p. 94

Ulcer-healing Drugs: plasma concentration of amiodarone increased by cimetidine

Amisulpride *see* Antipsychotics

Amitriptyline *see* Antidepressants, Tricyclic

Amlodipine *see* Calcium-channel Blockers

Amobarbital *see* Barbiturates

Amoxicillin *see* Penicillins

Amphotericin

Note Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics

Antibacterials: increased risk of nephrotoxicity when amphotericin given with aminoglycosides or polymyxins; possible increased risk of nephrotoxicity when amphotericin given with vancomycin

Antifungals: amphotericin reduces renal excretion and increases cellular uptake of flucytosine (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles; plasma concentration of amphotericin possibly increased by micafungin

- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with •cardiac glycosides
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with •ciclosporin
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with •corticosteroids—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with •arsenic trioxide

Diuretics: increased risk of hypokalaemia when amphotericin given with loop diuretics or thiazides and related diuretics

Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with pentamidine isetionate

- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with •tacrolimus

Ampicillin *see* Penicillins

Anabolic Steroids

- Anticoagulants: anabolic steroids enhance anticoagulant effect of •coumarins and •phenindione

Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of antidiabetics

Anaesthetics, General

Note *See also* Surgery and Long-term Medication, p. 775

ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE inhibitors

- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with •adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with •alpha-blockers

Analgesics: metabolism of etomidate inhibited by fentanyl (consider reducing dose of etomidate); effects of thiopental possibly enhanced by aspirin; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with angiotensin-II receptor antagonists

Antibacterials: effects of thiopental enhanced by sulfonamides; hypersensitivity-like reactions can occur when general anaesthetics given with *intravenous* vancomycin

Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics

- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with •antipsychotics; effects of thiopental enhanced by droperidol

Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when general anaesthetics given with beta-blockers

- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics enhance hypotensive effect of •verapamil (also AV delay)

Clonidine: enhanced hypotensive effect when general anaesthetics given with clonidine

Anaesthetics, General *(continued)*

- Cytotoxics: nitrous oxide increases antifolate effect of •methotrexate—avoid concomitant use

Diazoxide: enhanced hypotensive effect when general anaesthetics given with diazoxide

Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics

- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with •levodopa
- Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with •doxapram (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

Ergot Alkaloids: halothane reduces effects of ergometrine on the parturient uterus

- Memantine: increased risk of CNS toxicity when ketamine given with •memantine (manufacturer of memantine advises avoid concomitant use)

Methyldopa: enhanced hypotensive effect when general anaesthetics given with methyldopa

Metoclopramide: effects of thiopental enhanced by metoclopramide

Moxonidine: enhanced hypotensive effect when general anaesthetics given with moxonidine

- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with •suxamethonium; volatile liquid general anaesthetics enhance effects of non-depolarising muscle relaxants and suxamethonium; ketamine enhances effects of atracurium

Nitrates: enhanced hypotensive effect when general anaesthetics given with nitrates

Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with oxytocin

Probenecid: effects of thiopental possibly enhanced by probenecid

- Sympathomimetics: increased risk of arrhythmias when volatile liquid general anaesthetics given with •adrenaline (epinephrine); increased risk of hypertension when volatile liquid general anaesthetics given with •methylphenidate

Theophylline: increased risk of convulsions when ketamine given with theophylline; increased risk of arrhythmias when halothane given with theophylline

Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with hydralazine, minoxidil or sodium nitroprusside

Anaesthetics, General (intravenous) *see* Anaesthetics, General

Anaesthetics, General (volatile liquids) *see* Anaesthetics, General

Anaesthetics, Local *see* Bupivacaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine

Anagrelide

- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with •cilostazol
- Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with •enoximone and •milrinone

Anakinra

- Adalimumab: avoid concomitant use of anakinra with •adalimumab
- Certolizumab pegol: avoid concomitant use of anakinra with •certolizumab pegol
- Etanercept: avoid concomitant use of anakinra with •etanercept
- Golimumab: avoid concomitant use of anakinra with •golimumab
- Infliximab: avoid concomitant use of anakinra with •infliximab
- Vaccines: avoid concomitant use of anakinra with live •vaccines (see p. 746)

Analgesics *see* Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists

ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol

Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin

Aliskiren: irbesartan possibly reduces plasma concentration of aliskiren

Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with general anaesthetics

Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised

Antibacterials: plasma concentration of losartan and its active metabolite reduced by rifampicin; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with trimethoprim

Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with heparins

Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs

Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with antipsychotics

Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers

- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with •ciclosporin

Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine

Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide

- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with •diuretics; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with •potassium-sparing diuretics and aldosterone antagonists

Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with levodopa

- Lithium: angiotensin-II receptor antagonists reduce excretion of •lithium (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with methyldopa

Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxisylyte

Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with nitrates

Angiotensin-II Receptor Antagonists *(continued)*

Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by oestrogens

- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with •potassium salts

Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alprostadil

Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with tacrolimus

Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with hydralazine, minoxidil or sodium nitroprusside

Antacids

Note Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE Inhibitors: antacids possibly reduce absorption of ACE inhibitors; antacids reduce absorption of captopril, enalapril and fosinopril

Analgesics: alkaline urine due to some antacids increases excretion of aspirin

Antibacterials: antacids reduce absorption of azithromycin, cefaclor, cefpodoxime, ciprofloxacin, isoniazid, levofloxacin, moxifloxacin, norfloxacin, ofloxacin, rifampicin and tetracyclines; avoid concomitant use of antacids with methenamine; oral magnesium salts (as magnesium trisilicate) reduce absorption of nitrofurantoin

Antiepileptics: antacids reduce absorption of gabapentin and phenytoin

Antifungals: antacids reduce absorption of itraconazole and ketoconazole

Antihistamines: antacids reduce absorption of fexofenadine

Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of proguanil

Antipsychotics: antacids reduce absorption of phenothiazines and sulpiride

Antivirals: antacids possibly reduce plasma concentration of atazanavir; antacids reduce absorption of tipranavir

Bile Acids: antacids possibly reduce absorption of bile acids

Bisphosphonates: antacids reduce absorption of bisphosphonates

Cardiac Glycosides: antacids possibly reduce absorption of digoxin

Corticosteroids: antacids reduce absorption of deflazacort

- Cytotoxics: antacids possibly reduce plasma concentration of •erlotinib—give antacids at least 4 hours before or 2 hours after erlotinib

Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)

Dipyridamole: antacids possibly reduce absorption of dipyridamole

Eltrombopag: antacids reduce absorption of eltrombopag (give at least 4 hours apart)

Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of *oral* iron

Lipid-regulating Drugs: antacids reduce absorption of rosuvastatin

Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)

Mycophenolate: antacids reduce absorption of mycophenolate

Penicillamine: antacids reduce absorption of penicillamine

Polystyrene Sulphonate Resins: risk of intestinal obstruction when aluminium hydroxide given with polystyrene sulphonate resins; risk of metabolic

Antacids

Polystyrene Sulphonate Resins *(continued)*
alkalosis when oral magnesium salts given with polystyrene sulphonate resins

Thyroid Hormones: antacids possibly reduce absorption of levothyroxine

Ulcer-healing Drugs: antacids possibly reduce absorption of lansoprazole

- Ulipristal: avoidance of antacids advised by manufacturer of ●ulipristal (plasma concentration of ulipristal possibly reduced)

Antazoline *see* Antihistamines

Anti-arrhythmics *see* Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecainide, Lidocaine, and Propafenone

Antibacterials *see* individual drugs

Antibiotics (cytotoxic) *see* Bleomycin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, and Mitoxantrone

Anticoagulants *see* Coumarins, Dabigatran etexilate, Heparins, Phenindione, and Rivaroxaban

Antidepressants *see* Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Tryptophan; Venlafaxine

Antidepressants, Noradrenaline Re-uptake Inhibitors *see* Reboxetine

Antidepressants, SSRI

Alcohol: sedative effects possibly increased when SSRIs given with alcohol

Anaesthetics, Local: fluvoxamine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine

- Analgesics: increased risk of bleeding when SSRIs given with ●NSAIDs or ●aspirin; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with ●tramadol

Anti-arrhythmics: fluoxetine increases plasma concentration of flecainide; paroxetine possibly inhibits metabolism of propafenone (increased risk of toxicity)

- Anticoagulants: SSRIs possibly enhance anticoagulant effect of ●coumarins
- Antidepressants: avoidance of fluvoxamine advised by manufacturer of ●reboxetine; possible increased serotonergic effects when SSRIs given with duloxetine; fluvoxamine inhibits metabolism of ●duloxetine—avoid concomitant use; CNS effects of SSRIs increased by ●MAOIs (risk of serious toxicity); citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping ●MAOIs, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; increased risk of CNS toxicity when escitalopram given with ●moclobemide, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start ●moclobemide for at least 1 week; after stopping fluoxetine do not start ●moclobemide for 5 weeks; increased serotonergic effects when SSRIs given with ●St John's wort—avoid concomitant use; fluvoxamine inhibits metabolism of ●agomelatine (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with mirtazapine; SSRIs increase plasma concentration of some ●tricyclics; agitation and nausea may occur when SSRIs given with ●tryptophan; CNS toxicity reported when fluoxetine given with tryptophan
- Antiepileptics: SSRIs antagonise anticonvulsant effect of ●antiepileptics (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of ●carbamazepine; plasma concentration of sertraline possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of paroxetine reduced by phenytoin and primidone; fluoxetine and fluvoxamine increase plasma concentration of ●phenytoin

Antihistamines: antidepressant effect of SSRIs possibly antagonised by cyproheptadine

- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine

Antimuscarinics: paroxetine increases plasma concentration of darifenacin and procyclidine

- Antipsychotics: avoidance of fluoxetine, fluvoxamine or sertraline advised by manufacturer of ●droperidol (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of ●clozapine, ●haloperidol and risperidone; fluvoxamine possibly increases plasma concentration of haloperidol; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly inhibit metabolism of ●aripiprazole (reduce dose of aripiprazole); citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine, paroxetine and sertraline increase plasma concentration of ●clozapine; fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of risperidone (increased risk of toxicity)
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ●ritonavir
- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of alprazolam; fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of ●melatonin—avoid concomitant use; sedative effects possibly increased when sertraline given with zolpidem

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine; fluoxetine and paroxetine possibly inhibit metabolism of atomoxetine

Barbiturates: SSRIs antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered); plasma concentration of paroxetine reduced by phenobarbital

Beta-blockers: citalopram and escitalopram increase plasma concentration of metoprolol; paroxetine possibly increases plasma concentration of metoprolol (enhanced effect); fluvoxamine increases plasma concentration of propranolol

Bupropion: plasma concentration of citalopram possibly increased by bupropion

Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of nifedipine (increased plasma concentration)

- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of ●clopidogrel
- Dopaminergics: caution with paroxetine advised by manufacturer of entacapone; increased risk of CNS toxicity when SSRIs given with ●rasagiline; fluvoxamine should not be started until 2 weeks after stopping ●rasagiline; fluoxetine should not be started until 2 weeks after stopping ●rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypertension and CNS excitation when paroxetine given with ●selegiline (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for

Antidepressants, SSRI

- Dopaminergics *(continued)*
  2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with •selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with •selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of selegiline
- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of •tamoxifen to active metabolite (avoid concomitant use)
- 5HT$_1$ Agonists: fluvoxamine inhibits the metabolism of frovatriptan; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with •sumatriptan; CNS toxicity reported when sertraline given with sumatriptan; fluvoxamine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Lithium: Increased risk of CNS effects when SSRIs given with •lithium (lithium toxicity reported)
- Muscle Relaxants: fluvoxamine increases plasma concentration of •tizanidine (increased risk of toxicity)—avoid concomitant use

  Parasympathomimetics: paroxetine increases plasma concentration of galantamine

  Ranolazine: paroxetine increases plasma concentration of ranolazine

  Roflumilast: fluvoxamine inhibits the metabolism of roflumilast

  Sympathomimetics: metabolism of SSRIs possibly inhibited by methylphenidate
- Theophylline: fluvoxamine increases plasma concentration of •theophylline (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)

  Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by cimetidine; fluvoxamine possibly increases plasma concentration of lansoprazole; plasma concentration of escitalopram increased by omeprazole

Antidepressants, SSRI (related) *see* Duloxetine and Venlafaxine

Antidepressants, Tricyclic

Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of adrenergic neurone blockers

- Alcohol: increased sedative effect when tricyclics given with •alcohol

  Alpha$_2$-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of apraclonidine and brimonidine

  Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with general anaesthetics
- Analgesics: increased risk of CNS toxicity when tricyclics given with •tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative effects possibly increased when tricyclics given with opioid analgesics
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with •amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with •disopyramide or •flecainide; avoidance of tricyclics advised by manufacturer of •dronedarone (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with •propafenone
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with •moxifloxacin—avoid concomitant use

Antidepressants, Tricyclic *(continued)*

- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of •coumarins
- Antidepressants: possible increased serotonergic effects when amitriptyline or clomipramine given with duloxetine; increased risk of hypertension and CNS excitation when tricyclics given with •MAOIs, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start •moclobemide for at least 1 week; plasma concentration of some tricyclics increased by •SSRIs; plasma concentration of amitriptyline reduced by St John's wort
- Antiepileptics: tricyclics antagonise anticonvulsant effect of •antiepileptics (convulsive threshold lowered); metabolism of tricyclics accelerated by •carbamazepine (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by •phenytoin; tricyclics antagonises anticonvulsant effect of •primidone (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

  Antifungals: plasma concentration of tricyclics possibly increased by terbinafine

  Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with antihistamines
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

  Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with antimuscarinics
- Antipsychotics: plasma concentration of tricyclics increased by •antipsychotics—possibly increased risk of ventricular arrhythmias; avoidance of tricyclics advised by manufacturer of •droperidol (risk of ventricular arrhythmias); possibly increased antimuscarinic side-effects when tricyclics given with clozapine; increased risk of antimuscarinic side-effects when tricyclics given with phenothiazines; increased risk of ventricular arrhythmias when tricyclics given with •pimozide—avoid concomitant use
- Antivirals: plasma concentration of tricyclics possibly increased by •ritonavir; increased risk of ventricular arrhythmias when tricyclics given with •saquinavir—avoid concomitant use

  Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with anxiolytics and hypnotics
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with •atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine
- Barbiturates: tricyclics antagonises anticonvulsant effect of •barbiturates (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Beta-blockers: plasma concentration of imipramine increased by labetalol and propranolol; increased risk of ventricular arrhythmias when tricyclics given with •sotalol

  Bupropion: plasma concentration of tricyclics possibly increased by bupropion (possible increased risk of convulsions)

  Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by diltiazem and verapamil; plasma concentration of imipramine increased by diltiazem and verapamil

  Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with cannabis extract
- Clonidine: tricyclics antagonise hypotensive effect of •clonidine, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with •arsenic trioxide

Antidepressants, Tricyclic *(continued)*

Disulfiram: metabolism of tricyclics inhibited by disulfiram (increased plasma concentration); concomitant amitriptyline reported to increase disulfiram reaction with alcohol

Diuretics: increased risk of postural hypotension when tricyclics given with diuretics

- Dopaminergics: caution with tricyclics advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with •rasagiline; CNS toxicity reported when tricyclics given with •selegiline

Histamine: tricyclics theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

Lithium: risk of toxicity when tricyclics given with lithium

Moxonidine: tricyclics possibly antagonise hypotensive effect of moxonidine (manufacturer of moxonidine advises avoid concomitant use)

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nicorandil: tricyclics possibly enhance hypotensive effect of nicorandil

Nitrates: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: antidepressant effect of tricyclics antagonised by oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with •pentamidine isetionate

Sodium Oxybate: increased risk of side-effects when tricyclics given with sodium oxybate

- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with •adrenaline (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk of hypertension and arrhythmias when tricyclics given with •noradrenaline (norepinephrine)

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with •alcohol

Alpha$_2$-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine

Anticoagulants: trazodone may enhance or reduce anticoagulant effect of warfarin

- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping •MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start •moclobemide for at least 1 week
- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of •antiepileptics (convulsive threshold lowered); plasma concentration of mianserin reduced by •carbamazepine and •phenytoin; metabolism of mianserin accelerated by •primidone (reduced plasma concentration)

Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with antihistamines

Antidepressants, Tricyclic (related) *(continued)*

- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Antimuscarinics: possibly increased antimuscarinic side-effects when tricyclic-related antidepressants given with antimuscarinics

- Antivirals: plasma concentration of trazodone increased by •ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with •saquinavir—avoid concomitant use

Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with anxiolytics and hypnotics

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

- Barbiturates: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of •barbiturates (convulsive threshold lowered); metabolism of mianserin accelerated by •phenobarbital (reduced plasma concentration)

Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with diazoxide

Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with hydralazine or sodium nitroprusside

Antidiabetics

Note Other oral drugs may be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE inhibitors

Alcohol: hypoglycaemic effect of antidiabetics enhanced by alcohol; increased risk of lactic acidosis when metformin given with alcohol

Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by anabolic steroids

- Analgesics: effects of sulfonylureas possibly enhanced by •NSAIDs

Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by disopyramide

- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by neomycin, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of glibenclamide possibly enhanced by norfloxacin; plasma concentration of nateglinide reduced by rifampicin; hypoglycaemic effect of repaglinide possibly antagonised by rifampicin; effects of sulfonylureas enhanced by •chloramphenicol; metabolism of tolbutamide accelerated by •rifamycins (reduced effect); metabolism of sulfonylureas possibly accelerated by •rifamycins (reduced effect); effects of sulfonylureas rarely enhanced by sulfonamides and trimethoprim; hypoglycaemic effect of sulfonylureas possibly enhanced by tetracyclines; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use
- Anticoagulants: exenatide possibly enhances anticoagulant effect of warfarin; hypoglycaemic effect of sulfonylureas possibly enhanced by •coumarins, also possible changes to anticoagulant effect

Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs

Antiepileptics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by topiramate; plasma concentration of metformin possibly increased by topiramate

Antidiabetics *(continued)*

- Antifungals: plasma concentration of sulfonylureas increased by •fluconazole and •miconazole; hypoglycaemic effect of gliclazide and glipizide enhanced by •miconazole—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by fluconazole; hypoglycaemic effect of repaglinide possibly enhanced by itraconazole; hypoglycaemic effect of glipizide possibly enhanced by posaconazole; plasma concentration of sulfonylureas possibly increased by voriconazole

  Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)

  Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by phenothiazines

  Antivirals: plasma concentration of tolbutamide possibly increased by ritonavir

  Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

  Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers

- Bosentan: increased risk of hepatotoxicity when glibenclamide given with •bosentan—avoid concomitant use

  Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine

  Cardiac Glycosides: acarbose possibly reduces plasma concentration of digoxin; sitagliptin increases plasma concentration of digoxin

  Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin

  Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids

- Cytotoxics: avoidance of repaglinide advised by manufacturer of •lapatinib

  Deferasirox: plasma concentration of repaglinide increased by deferasirox

  Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide

  Diuretics: hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics

  Hormone Antagonists: requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by lanreotide; requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by octreotide

  Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide

- Lipid-regulating Drugs: absorption of glibenclamide reduced by colesevelam; hypoglycaemic effect of acarbose possibly enhanced by colestyramine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with •gemfibrozil—avoid concomitant use; plasma concentration of glibenclamide possibly increased by fluvastatin; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with fibrates

  Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens

  Orlistat: avoidance of acarbose advised by manufacturer of orlistat

  Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin

  Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens

- Sulfinpyrazone: effects of sulfonylureas enhanced by •sulfinpyrazone

  Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone

  Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration);

Antidiabetics

Ulcer-healing Drugs *(continued)*

hypoglycaemic effect of sulfonylureas enhanced by cimetidine

Antiepileptics *see* Carbamazepine, Eslicarbazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Phenytoin, Primidone, Rufinamide, Stiripentol, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide

Antifungals *see* Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole

Aliskiren: ketoconazole increases plasma concentration of aliskiren

Alpha-blockers: ketoconazole possibly increases plasma concentration of alfuzosin

- Analgesics: ketoconazole inhibits metabolism of •buprenorphine (reduce dose of buprenorphine)

  Antacids: absorption of ketoconazole reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with •disopyramide—avoid concomitant use; ketoconazole increases plasma concentration of •dronedarone—avoid concomitant use

- Antibacterials: metabolism of ketoconazole accelerated by •rifampicin (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of ketoconazole possibly reduced by isoniazid; avoidance of concomitant ketoconazole in severe renal and hepatic impairment advised by manufacturer of •telithromycin

- Anticoagulants: miconazole enhances anticoagulant effect of •coumarins (miconazole oral gel and possibly vaginal formulations absorbed); ketoconazole enhances anticoagulant effect of •coumarins; ketoconazole increases plasma concentration of •rivaroxaban—avoid concomitant use

- Antidepressants: avoidance of imidazoles advised by manufacturer of •reboxetine; ketoconazole increases plasma concentration of mirtazapine

- Antidiabetics: miconazole enhances hypoglycaemic effect of •gliclazide and •glipizide—avoid concomitant use; miconazole increases plasma concentration of •sulfonylureas

- Antiepileptics: ketoconazole and miconazole possibly increase plasma concentration of carbamazepine; miconazole enhances anticonvulsant effect of •phenytoin (plasma concentration of phenytoin increased); plasma concentration of ketoconazole reduced by •phenytoin

  Antifungals: imidazoles possibly antagonise effects of amphotericin

- Antihistamines: manufacturer of loratadine advises ketoconazole possibly increases plasma concentration of loratadine; imidazoles possibly inhibit metabolism of •mizolastine (avoid concomitant use); ketoconazole inhibits metabolism of •mizolastine—avoid concomitant use; ketoconazole increases plasma concentration of rupatadine

- Antimalarials: avoidance of imidazoles advised by manufacturer of •artemether/lumefantrine; ketoconazole increases plasma concentration of mefloquine

  Antimuscarinics: absorption of ketoconazole reduced by antimuscarinics; ketoconazole increases plasma concentration of darifenacin—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with fesoterodine—consult fesoterodine product literature; ketoconazole increases plasma concentration of solifenacin; avoidance of ketoconazole advised by manufacturer of tolterodine

- Antipsychotics: ketoconazole inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); increased

Antifungals, Imidazole

- Antipsychotics *(continued)*
  risk of ventricular arrhythmias when imidazoles given with •pimozide—avoid concomitant use; imidazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine)
- Antivirals: plasma concentration of both drugs increased when ketoconazole given with darunavir; plasma concentration of ketoconazole increased by fosamprenavir (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of •indinavir and •maraviroc (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by •nevirapine—avoid concomitant use; combination of ketoconazole with •ritonavir may increase plasma concentration of either drug (or both); ketoconazole increases plasma concentration of saquinavir; imidazoles possibly increase plasma concentration of saquinavir
- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of alprazolam; ketoconazole increases plasma concentration of •midazolam (risk of prolonged sedation)
  Aprepitant: ketoconazole increases plasma concentration of aprepitant
  Bosentan: ketoconazole increases plasma concentration of bosentan
- Calcium-channel Blockers: ketoconazole inhibits metabolism of •felodipine (increased plasma concentration); avoidance of ketoconazole advised by manufacturer of lercanidipine; ketoconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Ciclosporin: ketoconazole inhibits metabolism of •ciclosporin (increased plasma concentration); miconazole possibly inhibits metabolism of •ciclosporin (increased plasma concentration)
  Cilostazol: ketoconazole increases plasma concentration of cilostazol (consider reducing dose of cilostazol)
  Cinacalcet: ketoconazole inhibits metabolism of cinacalcet (increased plasma concentration)
- Clopidogrel: ketoconazole possibly reduces antiplatelet effect of •clopidogrel
- Colchicine: ketoconazole possibly increases risk of •colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  Corticosteroids: ketoconazole possibly inhibits metabolism of corticosteroids; ketoconazole increases plasma concentration of *inhaled* and *oral* budesonide; ketoconazole increases plasma concentration of active metabolite of ciclesonide; ketoconazole inhibits the metabolism of methylprednisolone; ketoconazole increases plasma concentration of *inhaled* mometasone
- Cytotoxics: ketoconazole possibly increases plasma concentration of dasatinib; ketoconazole inhibits metabolism of erlotinib and sunitinib (increased plasma concentration); ketoconazole increases plasma concentration of •everolimus, •lapatinib and •nilotinib—avoid concomitant use; ketoconazole increases plasma concentration of bortezomib and imatinib; avoidance of ketoconazole advised by manufacturer of •pazopanib; ketoconazole increases plasma concentration of active metabolite of •temsirolimus—avoid concomitant use; *in vitro* studies suggest a possible interaction between ketoconazole and docetaxel (consult docetaxel product literature); ketoconazole reduces plasma concentration of •irinotecan (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; ketoconazole increases plasma concentration of •vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of •eplerenone—avoid concomitant use

Antifungals, Imidazole *(continued)*

- Domperidone: ketoconazole possibly increases risk of arrhythmias with •domperidone
- Ergot Alkaloids: increased risk of ergotism when imidazoles given with •ergotamine and methysergide—avoid concomitant use
- 5HT$_1$ Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of •eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: ketoconazole increases plasma concentration of •ivabradine—avoid concomitant use
  Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin or simvastatin; increased risk of myopathy when ketoconazole given with •simvastatin (avoid concomitant use); possible increased risk of myopathy when miconazole given with •simvastatin—avoid concomitant use
  Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with oestrogens
  Parasympathomimetics: ketoconazole increases plasma concentration of galantamine
- Ranolazine: ketoconazole increases plasma concentration of •ranolazine—avoid concomitant use
  Retinoids: ketoconazole increases plasma concentration of alitretinoin
  Sildenafil: ketoconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: ketoconazole increases plasma concentration of •sirolimus—avoid concomitant use; miconazole increases plasma concentration of •sirolimus
  Sympathomimetics, Beta$_2$: ketoconazole inhibits metabolism of salmeterol (increased plasma concentration)
- Tacrolimus: imidazoles possibly increase plasma concentration of •tacrolimus; ketoconazole increases plasma concentration of •tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: ketoconazole increases plasma concentration of •tadalafil—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ketoconazole possibly increases plasma concentration of •theophylline
  Tolvaptan: ketoconazole increases plasma concentration of tolvaptan
  Ulcer-healing Drugs: absorption of ketoconazole reduced by histamine H$_2$-antagonists, proton pump inhibitors and sucralfate
- Vardenafil: ketoconazole increases plasma concentration of •vardenafil—avoid concomitant use
  Vitamins: ketoconazole possibly increases plasma concentration of paricalcitol

Antifungals, Polyene *see* Amphotericin

Antifungals, Triazole

Note In general, fluconazole interactions relate to multiple-dose treatment

- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of diclofenac and ibuprofen; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of •alfentanil and •methadone (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of alfentanil; triazoles possibly increase plasma concentration of •fentanyl
  Antacids: absorption of itraconazole reduced by antacids
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with •disopyramide; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of •dronedarone

Antifungals, Triazole *(continued)*

- Antibacterials: plasma concentration of itraconazole increased by clarithromycin; triazoles possibly increase plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of ●rifabutin (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ●rifabutin, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ●rifabutin—avoid concomitant use; plasma concentration of posaconazole reduced by ●rifampicin; plasma concentration of voriconazole reduced by ●rifampicin—avoid concomitant use; metabolism of fluconazole and itraconazole accelerated by ●rifampicin (reduced plasma concentration)
- Anticoagulants: fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ●coumarins; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of rivaroxaban
- Antidepressants: avoidance of triazoles advised by manufacturer of ●reboxetine; plasma concentration of voriconazole reduced by ●St John's wort—avoid concomitant use
- Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of glipizide; fluconazole possibly enhances hypoglycaemic effect of nateglinide; itraconazole possibly enhances hypoglycaemic effect of repaglinide; fluconazole increases plasma concentration of ●sulfonylureas; voriconazole possibly increases plasma concentration of sulfonylureas
- Antiepileptics: fluconazole possibly increases plasma concentration of carbamazepine; plasma concentration of voriconazole possibly reduced by ●carbamazepine and ●primidone—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ●carbamazepine; fluconazole increases plasma concentration of ●phenytoin (consider reducing dose of phenytoin); voriconazole increases plasma concentration of ●phenytoin, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); plasma concentration of posaconazole reduced by ●phenytoin; plasma concentration of itraconazole reduced by ●phenytoin—avoid concomitant use; plasma concentration of posaconazole possibly reduced by ●primidone

  Antifungals: triazoles possibly antagonise effects of amphotericin; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole)
- Antihistamines: itraconazole inhibits metabolism of ●mizolastine—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of ●artemether/lumefantrine

  Antimuscarinics: avoidance of itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when itraconazole given with fesoterodine—consult fesoterodine product literature; itraconazole increases plasma concentration of solifenacin
- Antipsychotics: itraconazole possibly increases plasma concentration of haloperidol; itraconazole possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when triazoles given with ●pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine)
- Antivirals: posaconazole increases plasma concentration of ●atazanavir; plasma concentration of itraconazole and posaconazole reduced by

Antifungals, Triazole

- Antivirals *(continued)*

  ●efavirenz; plasma concentration of voriconazole reduced by ●efavirenz, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of both drugs may increase when itraconazole given with fosamprenavir; itraconazole increases plasma concentration of ●indinavir (consider reducing dose of indinavir); plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; fluconazole increases plasma concentration of ●nevirapine, ritonavir and tipranavir; plasma concentration of voriconazole reduced by ●ritonavir—avoid concomitant use; combination of itraconazole with ●ritonavir may increase plasma concentration of either drug (or both); triazoles possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of ●zidovudine (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of ●midazolam; fluconazole and itraconazole increase plasma concentration of ●midazolam (risk of prolonged sedation); itraconazole increases plasma concentration of buspirone (reduce dose of buspirone)
- Barbiturates: plasma concentration of itraconazole and posaconazole possibly reduced by ●phenobarbital; plasma concentration of voriconazole possibly reduced by ●phenobarbital—avoid concomitant use
- Bosentan: fluconazole possibly increases plasma concentration of ●bosentan—avoid concomitant use; itraconazole possibly increases plasma concentration of bosentan
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with calcium-channel blockers; itraconazole inhibits metabolism of ●felodipine (increased plasma concentration); avoidance of itraconazole advised by manufacturer of lercanidipine; itraconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of ●digoxin
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ●ciclosporin (increased plasma concentration)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of ●clopidogrel
- Colchicine: itraconazole possibly increases risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

  Corticosteroids: itraconazole possibly inhibits metabolism of corticosteroids and methylprednisolone; itraconazole increases plasma concentration of *inhaled* budesonide
- Cytotoxics: itraconazole inhibits metabolism of busulfan (increased risk of toxicity); itraconazole possibly increases side-effects of cyclophosphamide; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ●everolimus—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of gefitinib; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●lapatinib; avoidance of itraconazole and voriconazole advised by manufacturer of ●nilotinib; avoidance of itraconazole and voriconazole advised by manufacturer of ●pazopanib; posaconazole possibly inhibits metabolism of ●vinblastine and ●vincristine (increased risk of neurotoxicity); itraconazole possibly inhibits metabolism of ●vincristine and ●vinorelbine (increased risk of neurotoxicity); itraconazole possibly increases

Antifungals, Triazole

- Cytotoxics *(continued)*
  plasma concentration of •vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Diuretics: fluconazole increases plasma concentration of eplerenone (reduce dose of eplerenone); itraconazole increases plasma concentration of •eplerenone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide
- Ergot Alkaloids: increased risk of ergotism when triazoles given with •ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: itraconazole increases plasma concentration of •eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of ivabradine—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of •ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when triazoles given with atorvastatin or simvastatin; increased risk of myopathy when itraconazole or posaconazole given with •atorvastatin (avoid concomitant use); fluconazole increases plasma concentration of fluvastatin; increased risk of myopathy when itraconazole or posaconazole given with •simvastatin (avoid concomitant use)

  Oestrogens: plasma concentration of voriconazole increased by oestrogens

  Progestogens: plasma concentration of voriconazole possibly increased by progestogens
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: posaconazole possibly increases plasma concentration of sirolimus; itraconazole and voriconazole increase plasma concentration of •sirolimus—avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of •tacrolimus (consider reducing dose of tacrolimus)

  Tadalafil: itraconazole possibly increases plasma concentration of tadalafil
- Theophylline: fluconazole possibly increases plasma concentration of •theophylline
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by •cimetidine; voriconazole possibly increases plasma concentration of esomeprazole; voriconazole increases plasma concentration of omeprazole (consider reducing dose of omeprazole); absorption of itraconazole reduced by histamine H_2-antagonists and proton pump inhibitors; manufacturer of posaconazole advises avoid concomitant use with histamine H_2-antagonists and proton pump inhibitors (plasma concentration of posaconazole possibly reduced)
- Vardenafil: itraconazole possibly increases plasma concentration of •vardenafil—avoid concomitant use

Antihistamines

Note Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)

- Analgesics: sedative effects possibly increased when sedating antihistamines given with •opioid analgesics

Antacids: absorption of fexofenadine reduced by antacids

Antihistamines *(continued)*

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with •amiodarone, •disopyramide, •flecainide or •propafenone—avoid concomitant use
- Antibacterials: plasma concentration of rupatadine increased by erythromycin; manufacturer of loratadine advises plasma concentration possibly increased by erythromycin; metabolism of mizolastine inhibited by •erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with •moxifloxacin—avoid concomitant use; effects of fexofenadine possibly reduced by rifampicin; metabolism of mizolastine possibly inhibited by •macrolides (avoid concomitant use)

  Antidepressants: increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; cyproheptadine possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepressants

  Antidiabetics: thrombocyte count depressed when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)
- Antifungals: plasma concentration of rupatadine increased by ketoconazole; manufacturer of loratadine advises plasma concentration possibly increased by ketoconazole; metabolism of mizolastine inhibited by •itraconazole or •ketoconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by •imidazoles (avoid concomitant use)

  Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics
- Antivirals: plasma concentration of chlorphenamine possibly increased by lopinavir; plasma concentration of non-sedating antihistamines possibly increased by ritonavir; increased risk of ventricular arrhythmias when mizolastine given with •saquinavir—avoid concomitant use

  Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with anxiolytics and hypnotics
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with •sotalol—avoid concomitant use

  Betahistine: antihistamines theoretically antagonise effect of betahistine
- Grapefruit Juice: plasma concentration of rupatadine increased by •grapefruit juice—avoid concomitant use

  Histamine: antihistamines theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

  Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by cimetidine

Antihistamines, Non-sedating *see* Antihistamines

Antihistamines, Sedating *see* Antihistamines

Antimalarials *see* Artemether with Lumefantrine, Chloroquine and Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine

Antimetabolites *see* Cytarabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, and Tioguanine

Antimuscarinics

Note Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation

Alcohol: increased sedative effect when hyoscine given with alcohol

Antimuscarinics *(continued)*

Analgesics: increased risk of antimuscarinic side-effects when antimuscarinics given with nefopam

- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with •amiodarone, •disopyramide or •flecainide; increased risk of antimuscarinic side-effects when antimuscarinics given with disopyramide

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possibly increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants

Antifungals: antimuscarinics reduce absorption of ketoconazole; manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole and ketoconazole—consult fesoterodine product literature; plasma concentration of darifenacin increased by ketoconazole—avoid concomitant use; plasma concentration of solifenacin increased by itraconazole and ketoconazole; manufacturer of tolterodine advises avoid concomitant use with itraconazole and ketoconazole; manufacturer of darifenacin advises avoid concomitant use with itraconazole

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines

Antipsychotics: antimuscarinics possibly reduce effects of haloperidol; increased risk of antimuscarinic side-effects when antimuscarinics given with clozapine; antimuscarinics reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased

Antivirals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with atazanavir, indinavir, nelfinavir, ritonavir and saquinavir—consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir; manufacturer of tolterodine advises avoid concomitant use with fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir and saquinavir; plasma concentration of solifenacin increased by nelfinavir and ritonavir

- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with •sotalol

Calcium-channel Blockers: manufacturer of darifenacin advises avoid concomitant use with verapamil

Cardiac Glycosides: darifenacin possibly increases plasma concentration of digoxin

Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with ciclosporin

Domperidone: antimuscarinics antagonise effects of domperidone on gastro-intestinal activity

Dopaminergics: antimuscarinics possibly reduce absorption of levodopa

Memantine: effects of antimuscarinics possibly enhanced by memantine

Metoclopramide: antimuscarinics antagonise effects of metoclopramide on gastro-intestinal activity

Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Parasympathomimetics: antimuscarinics antagonise effects of parasympathomimetics

Antipsychotics

Note Increased risk of toxicity with myelosuppressive drugs

Note Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with adrenergic neurone blockers; higher doses of chlorpromazine antagonise hypotensive effect of adrenergic neurone blockers; haloperidol antagonises hypotensive effect of adrenergic neurone blockers

Adsorbents: absorption of phenothiazines possibly reduced by kaolin

Alcohol: increased sedative effect when antipsychotics given with alcohol

Alpha-blockers: enhanced hypotensive effect when antipsychotics given with alpha-blockers

- Anaesthetics, General: droperidol enhances effects of thiopental; enhanced hypotensive effect when antipsychotics given with •general anaesthetics
- Analgesics: possible severe drowsiness when haloperidol given with indometacin; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with •methadone; increased risk of ventricular arrhythmias when amisulpride given with •methadone—avoid concomitant use; increased risk of convulsions when antipsychotics given with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists

Antacids: absorption of phenothiazines and sulpiride reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with •anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with •amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with •amiodarone—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with •amiodarone or •disopyramide; possible increased risk of ventricular arrhythmias when haloperidol given with •disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with •disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with •disopyramide; avoidance of phenothiazines advised by manufacturer of •dronedarone (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with •flecainide
- Antibacterials: increased risk of ventricular arrhythmias when pimozide given with •clarithromycin, •moxifloxacin or •telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with •erythromycin—avoid concomitant use; plasma concentration of clozapine possibly increased by •erythromycin (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with •erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with *parenteral* •erythromycin; increased risk of ventricular arrhythmias when zuclopenthixol given with *parenteral* •erythromycin—avoid concomitant use; plasma concentration of clozapine increased by ciprofloxacin; plasma concentration of olanzapine possibly increased by ciprofloxacin; increased risk of ventricular arrhythmias when droperidol, halo-

Antipsychotics

- Antibacterials *(continued)*
  peridol, phenothiazines or zuclopenthixol given with •moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with •moxifloxacin—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by •rifabutin and •rifampicin—increase dose of aripiprazole; plasma concentration of clozapine possibly reduced by rifampicin; metabolism of haloperidol accelerated by •rifampicin (reduced plasma concentration); avoid concomitant use of clozapine with •chloramphenicol or •sulfonamides (increased risk of agranulocytosis); plasma concentration of quetiapine possibly increased by macrolides (reduce dose of quetiapine); manufacturer of droperidol advises avoid concomitant use with •macrolides (risk of ventricular arrhythmias)
- Antidepressants: plasma concentration of clozapine possibly increased by citalopram (increased risk of toxicity); metabolism of aripiprazole possibly inhibited by •fluoxetine and •paroxetine (reduce dose of aripiprazole); plasma concentration of clozapine, haloperidol and risperidone increased by •fluoxetine; manufacturer of droperidol advises avoid concomitant use with •fluoxetine, •fluvoxamine, •sertraline or •tricyclics (risk of ventricular arrhythmias); plasma concentration of clozapine and olanzapine increased by •fluvoxamine; plasma concentration of haloperidol possibly increased by fluvoxamine; plasma concentration of clozapine increased by •paroxetine, •sertraline and •venlafaxine; plasma concentration of risperidone possibly increased by paroxetine (increased risk of toxicity); metabolism of perphenazine inhibited by paroxetine (reduce dose of perphenazine); plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of •MAOIs; plasma concentration of pimozide possibly increased by •SSRIs (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by •St John's wort—increase dose of aripiprazole; increased risk of antimuscarinic side-effects when phenothiazines given with tricyclics; increased risk of ventricular arrhythmias when pimozide given with •tricyclics—avoid concomitant use; possibly increased antimuscarinic side-effects when clozapine given with tricyclics; antipsychotics increase plasma concentration of •tricyclics—possibly increased risk of ventricular arrhythmias

  Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulfonylureas
- Antiepileptics: metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by carbamazepine (reduced plasma concentration); metabolism of clozapine accelerated by •carbamazepine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by •carbamazepine—increase dose of aripiprazole; plasma concentration of paliperidone reduced by carbamazepine; antipsychotics antagonise anticonvulsant effect of •carbamazepine, •ethosuximide, •oxcarbazepine, •phenytoin, •primidone and •valproate (convulsive threshold lowered); chlorpromazine possibly increases or decreases plasma concentration of phenytoin; metabolism of clozapine and quetiapine accelerated by phenytoin (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by •phenytoin and •primidone—increase dose of aripiprazole; plasma concentration of haloperidol reduced by phenytoin; metabolism of haloperidol accelerated by primidone (reduced plasma

Antipsychotics

- Antiepileptics *(continued)*
  concentration); plasma concentration of quetiapine possibly increased by valproate; increased risk of side-effects including neutropenia when olanzapine given with •valproate; plasma concentration of clozapine possibly increased or decreased by valproate
- Antifungals: metabolism of aripiprazole inhibited by •ketoconazole (reduce dose of aripiprazole); metabolism of aripiprazole possibly inhibited by •itraconazole (reduce dose of aripiprazole); plasma concentration of haloperidol possibly increased by itraconazole; increased risk of ventricular arrhythmias when pimozide given with •imidazoles or •triazoles—avoid concomitant use; plasma concentration of quetiapine possibly increased by imidazoles and triazoles (reduce dose of quetiapine)
- Antimalarials: avoidance of antipsychotics advised by manufacturer of •artemether/lumefantrine; increased risk of ventricular arrhythmias when droperidol given with •chloroquine and hydroxychloroquine or •quinine—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •mefloquine or •quinine—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with •mefloquine or •quinine—avoid concomitant use

  Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with antimuscarinics; plasma concentration of phenothiazines reduced by antimuscarinics, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by antimuscarinics
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with •droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with •droperidol—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of •flupentixol, •fluphenazine, •haloperidol, •pipotiazine, •risperidone or •zuclopenthixol as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with •haloperidol; chlorpromazine possibly increases plasma concentration of haloperidol; increased risk of ventricular arrhythmias when droperidol given with •haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •phenothiazines—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with •sulpiride
- Antivirals: metabolism of aripiprazole possibly inhibited by •atazanavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir and •saquinavir (reduce dose of aripiprazole); plasma concentration of pimozide possibly increased by •atazanavir—avoid concomitant use; plasma concentration of pimozide possibly increased by •efavirenz, •indinavir, •nelfinavir and •saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by •efavirenz and •nevirapine—increase dose of aripiprazole; plasma concentration of pimozide increased by •fosamprenavir and •ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of clozapine increased by •ritonavir (increased risk of toxicity)—avoid concomitant use; plasma concentration of antipsychotics possibly increased by •ritonavir; plasma concentration of olanzapine reduced by ritonavir—consider increasing dose of olanzapine; increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with •saquinavir—avoid concomitant use

Antipsychotics *(continued)*

- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with anxiolytics and hypnotics; serious adverse events reported with concomitant use of clozapine and •lorazepam (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *intramuscular* olanzapine given with *parenteral* •benzodiazepines; plasma concentration of haloperidol increased by buspirone
- Aprepitant: avoidance of pimozide advised by manufacturer of •aprepitant
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with •atomoxetine
- Barbiturates: antipsychotics antagonise anticonvulsant effect of •barbiturates (convulsive threshold lowered); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with phenobarbital; plasma concentration of aripiprazole possibly reduced by •phenobarbital—increase dose of aripiprazole
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with beta-blockers; plasma concentration of both drugs may increase when chlorpromazine given with •propranolol; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with •sotalol; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with •sotalol—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with •sotalol—avoid concomitant use

  Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with calcium-channel blockers

  Clonidine: enhanced hypotensive effect when phenothiazines given with clonidine
- Cytotoxics: avoid concomitant use of clozapine with •cytotoxics (increased risk of agranulocytosis); avoidance of pimozide advised by manufacturer of •lapatinib; increased risk of ventricular arrhythmias when haloperidol given with •arsenic trioxide; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with •arsenic trioxide

  Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with desferrioxamine; avoidance of prochlorperazine advised by manufacturer of desferrioxamine

  Diazoxide: enhanced hypotensive effect when phenothiazines given with diazoxide
- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by •diuretics; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by •diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with diuretics

  Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with amantadine; antipsychotics antagonise effects of apomorphine, levodopa and pergolide; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of bromocriptine and cabergoline; manufacturer of amisulpride advises avoid concomitant use of levodopa (antagonism of effect); avoidance of antipsychotics advised by manufacturer of pramipexole, ropinirole and rotigotine (antagonism of effect)

  Histamine: antipsychotics theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with •tamoxifen (risk of ventricular arrhythmias)

Antipsychotics *(continued)*

- Ivabradine: increased risk of ventricular arrhythmias when pimozide given with •ivabradine

  Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol given with lithium; possible risk of toxicity when olanzapine given with lithium; increased risk of extrapyramidal side-effects when sulpiride given with lithium

  Memantine: effects of antipsychotics possibly reduced by memantine

  Methyldopa: enhanced hypotensive effect when antipsychotics given with methyldopa (also increased risk of extrapyramidal effects)

  Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with metoclopramide

  Moxonidine: enhanced hypotensive effect when phenothiazines given with moxonidine

  Muscle Relaxants: promazine possibly enhances effects of suxamethonium

  Nitrates: enhanced hypotensive effect when phenothiazines given with nitrates
- Penicillamine: avoid concomitant use of clozapine with •penicillamine (increased risk of agranulocytosis)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with •pentamidine isetionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with •pentamidine isetionate

  Sodium Benzoate: haloperidol possibly reduces effects of sodium benzoate

  Sodium Oxybate: antipsychotics possibly enhance effects of sodium oxybate

  Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

  Sympathomimetics: antipsychotics antagonise hypertensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamfetamine; side-effects of risperidone possibly increased by methylphenidate
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with •tacrolimus (risk of ventricular arrhythmias)

  Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrabenazine

  Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by cimetidine; plasma concentration of clozapine possibly reduced by omeprazole; absorption of sulpiride reduced by sucralfate

  Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals *see* Abacavir, Aciclovir, Adefovir, Atazanavir, Cidofovir, Darunavir, Didanosine, Efavirenz, Emtricitabine, Etravirine, Famciclovir, Fosamprenavir, Foscarnet, Ganciclovir, Indinavir, Lamivudine, Lopinavir, Maraviroc, Nelfinavir, Nevirapine, Raltegravir, Ribavirin, Ritonavir, Saquinavir, Stavudine, Telbivudine, Tenofovir, Tipranavir, Valaciclovir, and Zidovudine

Anxiolytics and Hypnotics

ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with adrenergic neurone blockers

Alcohol: increased sedative effect when anxiolytics and hypnotics given with alcohol

Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with alpha-blockers

Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with general anaesthetics

Anxiolytics and Hypnotics *(continued)*

Analgesics: metabolism of midazolam possibly inhibited by fentanyl; increased sedative effect when anxiolytics and hypnotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with angiotensin-II receptor antagonists

- Antibacterials: metabolism of midazolam inhibited by ●clarithromycin, ●erythromycin and ●telithromycin (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by erythromycin (reduce dose of buspirone); metabolism of zopiclone inhibited by erythromycin; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentration); metabolism of diazepam accelerated by rifampicin (reduced plasma concentration); metabolism of buspirone and zaleplon possibly accelerated by rifampicin; metabolism of zolpidem accelerated by rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by rifampicin; metabolism of diazepam inhibited by isoniazid

  Anticoagulants: chloral and triclofos may transiently enhance anticoagulant effect of coumarins
- Antidepressants: plasma concentration of alprazolam increased by fluoxetine; plasma concentration of melatonin increased by ●fluvoxamine—avoid concomitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspirone advises avoid concomitant use with MAOIs; avoidance of buspirone for 10 days after stopping tranylcypromine advised by manufacturer of tranylcypromine; plasma concentration of *oral* midazolam possibly reduced by St John's wort; increased sedative effect when anxiolytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricyclics

  Antiepileptics: plasma concentration of midazolam reduced by carbamazepine; plasma concentration of clonazepam often reduced by carbamazepine, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of phenytoin; diazepam increases or decreases plasma concentration of phenytoin; plasma concentration of clobazam increased by stiripentol; clobazam possibly increases plasma concentration of valproate; plasma concentration of diazepam and lorazepam possibly increased by valproate; increased risk of side-effects when clonazepam given with valproate
- Antifungals: plasma concentration of alprazolam increased by itraconazole and ketoconazole; plasma concentration of midazolam increased by ●fluconazole, ●itraconazole and ●ketoconazole (risk of prolonged sedation); plasma concentration of buspirone increased by itraconazole (reduce dose of buspirone); plasma concentration of midazolam increased by ●posaconazole

  Antihistamines: increased sedative effect when anxiolytics and hypnotics given with antihistamines
- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with antipsychotics; buspirone increases plasma concentration of haloperidol; serious adverse events reported with concomitant use of lorazepam and ●clozapine (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *parenteral* benzodiazepines given with *intramuscular* ●olanzapine
- Antivirals: plasma concentration of midazolam possibly increased by ●atazanavir—avoid concomitant use of *oral* midazolam; increased risk of prolonged sedation when midazolam given with ●efavirenz—avoid concomitant use; plasma concentration of midazolam possibly increased by ●fosamprenavir, ●indinavir, ●nelfinavir and ●ritonavir (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); increased risk of prolonged sedation when alprazolam given with ●indinavir—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ●ritonavir (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by ●ritonavir; plasma concentration of buspirone increased by ritonavir (increased risk of toxicity); plasma concentration of midazolam increased by ●saquinavir (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)

Anxiolytics and Hypnotics

- Antivirals *(continued)*

  Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation)

  Barbiturates: plasma concentration of clonazepam often reduced by phenobarbital

  Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with beta-blockers

  Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; plasma concentration of buspirone increased by diltiazem and verapamil (reduce dose of buspirone); metabolism of midazolam inhibited by diltiazem and verapamil (increased plasma concentration with increased sedation)

  Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)

  Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with clonidine

  Cytotoxics: plasma concentration of midazolam increased by nilotinib

  Deferasirox: plasma concentration of midazolam possibly reduced by deferasirox

  Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with diazoxide

  Disulfiram: metabolism of benzodiazepines inhibited by disulfiram (increased sedative effects); increased risk of temazepam toxicity when given with disulfiram

  Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with diuretics; administration of chloral or triclofos with *parenteral* furosemide may displace thyroid hormone from binding sites

  Dopaminergics: benzodiazepines possibly antagonise effects of levodopa

  Grapefruit Juice: plasma concentration of buspirone increased by grapefruit juice

  Lithium: increased risk of neurotoxicity when clonazepam given with lithium

  Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine

  Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with methyldopa

  Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine; sedative effects possibly increased when benzodiazepines given with moxonidine

  Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine

  Nabilone: increased sedative effect when anxiolytics and hypnotics given with nabilone

  Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrates

  Oestrogens: plasma concentration of melatonin increased by oestrogens

  Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)

Anxiolytics and Hypnotics *(continued)*
- Sodium Oxybate: benzodiazepines enhance effects of ●sodium oxybate (avoid concomitant use)

Theophylline: effects of benzodiazepines possibly reduced by theophylline

Ulcer-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration)

Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with hydralazine, minoxidil or sodium nitroprusside

Apomorphine

Antipsychotics: effects of apomorphine antagonised by antipsychotics

Dopaminergics: effects of apomorphine possibly enhanced by entacapone

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Apraclonidine

Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Aprepitant

Note Fosaprepitant is a prodrug of aprepitant

Antibacterials: plasma concentration of aprepitant possibly increased by clarithromycin and telithromycin; plasma concentration of aprepitant reduced by rifampicin

Anticoagulants: aprepitant possibly reduces anticoagulant effect of warfarin

- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with ●St John's wort

Antidiabetics: aprepitant reduces plasma concentration of tolbutamide

Antiepileptics: plasma concentration of aprepitant possibly reduced by carbamazepine and phenytoin

Antifungals: plasma concentration of aprepitant increased by ketoconazole

- Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with ●pimozide

Antivirals: plasma concentration of aprepitant possibly increased by ritonavir

Anxiolytics and Hypnotics: aprepitant increases plasma concentration of midazolam (risk of prolonged sedation)

Barbiturates: plasma concentration of aprepitant possibly reduced by phenobarbital

Calcium-channel Blockers: plasma concentration of both drugs may increase when aprepitant given with diltiazem

Corticosteroids: aprepitant inhibits metabolism of dexamethasone and methylprednisolone (reduce dose of dexamethasone and methylprednisolone)

- Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ●oestrogens (alternative contraception recommended)
- Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing ●progestogens (alternative contraception recommended)

Aripiprazole *see* Antipsychotics

Arsenic Trioxide
- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with ●amiodarone or ●disopyramide
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with ●erythromycin, ●levofloxacin or ●moxifloxacin
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with ●amitriptyline or ●clomipramine

Arsenic Trioxide *(continued)*

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with ●amphotericin
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with ●antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with ●haloperidol; avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with ●sotalol

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by ●acetazolamide, ●loop diuretics or ●thiazides and related diuretics
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with ●lithium

Artemether with Lumefantrine
- Anti-arrhythmics: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●amiodarone, ●disopyramide or ●flecainide (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●macrolides and ●quinolones
- Antidepressants: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antidepressants
- Antifungals: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●imidazoles and ●triazoles
- Antimalarials: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antimalarials; increased risk of ventricular arrhythmias when artemether/lumefantrine given with ●quinine
- Antipsychotics: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●antipsychotics

Antivirals: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir
- Beta-blockers: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●metoprolol and ●sotalol

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice

Histamine: avoidance of antimalarials advised by manufacturer of histamine
- Ulcer-healing Drugs: manufacturer of artemether/lumefantrine advises avoid concomitant use with ●cimetidine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Ascorbic acid *see* Vitamins

Aspirin

Adsorbents: absorption of aspirin possibly reduced by kaolin

Anaesthetics, General: aspirin possibly enhances effects of thiopental
- Analgesics: avoid concomitant use of aspirin with ●NSAIDs (increased side-effects); antiplatelet effect of aspirin possibly reduced by ibuprofen

Antacids: excretion of aspirin increased by alkaline urine due to some antacids
- Anticoagulants: increased risk of bleeding when aspirin given with ●coumarins or ●phenindione (due to antiplatelet effect); aspirin enhances anticoagulant effect of ●heparins
- Antidepressants: increased risk of bleeding when aspirin given with ●SSRIs or ●venlafaxine

Aspirin *(continued)*

Antiepileptics: aspirin enhances effects of phenytoin and valproate

Clopidogrel: increased risk of bleeding when aspirin given with clopidogrel

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate

- Cytotoxics: aspirin reduces excretion of •methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647

Diuretics: aspirin antagonises diuretic effect of spironolactone; increased risk of toxicity when high-dose aspirin given with carbonic anhydrase inhibitors

Iloprost: increased risk of bleeding when aspirin given with iloprost

Leukotriene Receptor Antagonists: aspirin increases plasma concentration of zafirlukast

Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect)

Probenecid: aspirin antagonises effects of probenecid

Sulfinpyrazone: aspirin antagonises effects of sulfinpyrazone

Atazanavir

Antacids: plasma concentration of atazanavir possibly reduced by antacids

- Anti-arrhythmics: atazanavir possibly increases plasma concentration of •amiodarone and •lidocaine
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of •rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by •rifampicin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of warfarin; avoidance of atazanavir advised by manufacturer of rivaroxaban

- Antidepressants: plasma concentration of atazanavir reduced by •St John's wort—avoid concomitant use
- Antifungals: plasma concentration of atazanavir increased by •posaconazole
- Antimalarials: caution with atazanavir advised by manufacturer of artemether/lumefantrine; atazanavir possibly increases plasma concentration of •quinine (increased risk of toxicity)

Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: atazanavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); atazanavir possibly increases plasma concentration of •pimozide—avoid concomitant use
- Antivirals: manufacturer of atazanavir advises avoid concomitant use with •efavirenz (plasma concentration of atazanavir reduced); avoid concomitant use of atazanavir with •indinavir; atazanavir increases plasma concentration of •maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by •nevirapine—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with •saquinavir—avoid concomitant use; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of tipranavir (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of •midazolam—avoid concomitant use of *oral* midazolam
- Calcium-channel Blockers: atazanavir increases plasma concentration of •diltiazem (reduce dose of

Atazanavir

- Calcium-channel Blockers *(continued)* diltiazem); atazanavir possibly increases plasma concentration of verapamil
- Ciclosporin: atazanavir possibly increases plasma concentration of •ciclosporin
- Colchicine: atazanavir possibly increases risk of •colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of •everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of atazanavir advised by manufacturer of •pazopanib; atazanavir possibly inhibits metabolism of •irinotecan (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of •ergot alkaloids—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin; possible increased risk of myopathy when atazanavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when atazanavir given with •simvastatin (avoid concomitant use)

Oestrogens: atazanavir increases plasma concentration of ethinylestradiol

- Ranolazine: atazanavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases side-effects of •sildenafil
- Sirolimus: atazanavir possibly increases plasma concentration of •sirolimus
- Tacrolimus: atazanavir possibly increases plasma concentration of •tacrolimus
- Ulcer-healing Drugs: plasma concentration of atazanavir reduced by •histamine H_2-antagonists; plasma concentration of atazanavir reduced by •proton pump inhibitors—avoid or adjust dose of both drugs (consult product literature)

Atenolol *see* Beta-blockers

Atomoxetine

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with •methadone; possible increased risk of convulsions when atomoxetine given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with •amiodarone or •disopyramide
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with *parenteral* •erythromycin; increased risk of ventricular arrhythmias when atomoxetine given with •moxifloxacin
- Antidepressants: metabolism of atomoxetine possibly inhibited by fluoxetine and paroxetine; possible increased risk of convulsions when atomoxetine given with antidepressants; atomoxetine should not be started until 2 weeks after stopping •MAOIs, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with •tricyclics
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with •mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with •antipsychotics that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with •sotalol

Bupropion: possible increased risk of convulsions when atomoxetine given with bupropion

- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by •diuretics

Atomoxetine *(continued)*
Sympathomimetics, $Beta_2$: Increased risk of cardiovascular side-effects when atomoxetine given with *parenteral* salbutamol

Atorvastatin *see* Statins

Atovaquone
- Antibacterials: plasma concentration of atovaquone reduced by •rifabutin and •rifampicin (possible therapeutic failure of atovaquone); plasma concentration of atovaquone reduced by tetracycline

Antivirals: atovaquone possibly reduces plasma concentration of indinavir; atovaquone possibly inhibits metabolism of zidovudine (increased plasma concentration)
Histamine: avoidance of atovaquone advised by manufacturer of histamine
Metoclopramide: plasma concentration of atovaquone reduced by metoclopramide

Atracurium *see* Muscle Relaxants

Atropine *see* Antimuscarinics

Azathioprine
ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with captopril especially in renal impairment; increased risk of anaemia when azathioprine given with enalapril especially in renal impairment
- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with •allopurinol (reduce dose of azathioprine to one quarter of usual dose)

Aminosalicylates: possible increased risk of leucopenia when azathioprine given with aminosalicylates
- Antibacterials: increased risk of haematological toxicity when azathioprine given with •sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with •trimethoprim (also with co-trimoxazole)
- Anticoagulants: azathioprine possibly reduces anticoagulant effect of •coumarins
- Antivirals: myelosuppressive effects of azathioprine possibly enhanced by •ribavirin
- Febuxostat: avoidance of azathioprine advised by manufacturer of •febuxostat

Azithromycin *see* Macrolides

Aztreonam
- Anticoagulants: aztreonam possibly enhances anticoagulant effect of •coumarins

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Baclofen *see* Muscle Relaxants

Balsalazide *see* Aminosalicylates

Bambuterol *see* Sympathomimetics, $Beta_2$

Barbiturates
Alcohol: increased sedative effect when barbiturates given with alcohol
Analgesics: phenobarbital reduces plasma concentration of methadone; barbiturates possibly increase CNS effects of opioid analgesics
- Anti-arrhythmics: barbiturates accelerate metabolism of disopyramide (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of •dronedarone—avoid concomitant use
- Antibacterials: barbiturates accelerate metabolism of •chloramphenicol, doxycycline and metronidazole (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of rifampicin; phenobarbital reduces plasma concentration of •telithromycin (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: barbiturates accelerate metabolism of •coumarins (reduced anticoagulant effect)
- Antidepressants: phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of •mianserin (reduced plasma concentration); anticonvulsant effect of barbiturates possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of barbiturates antagonised by SSRIs (convulsive threshold lowered); avoid concomitant use of phenobarbital with •St John's wort; anticonvulsant effect of barbiturates antagonised by •tricyclics (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Antiepileptics: phenobarbital reduces plasma concentration of carbamazepine, lamotrigine, tiagabine and zonisamide; phenobarbital possibly reduces plasma concentration of ethosuximide; plasma concentration of phenobarbital increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by phenytoin, plasma concentration of phenytoin often reduced but may be increased; increased sedative effect when barbiturates given with primidone; phenobarbital possibly reduces plasma concentration of rufinamide, also plasma concentration of phenobarbital possibly increased; plasma concentration of phenobarbital increased by •stiripentol; plasma concentration of phenobarbital increased by valproate (also plasma concentration of valproate reduced); plasma concentration of phenobarbital possibly reduced by vigabatrin
- Antifungals: phenobarbital possibly reduces plasma concentration of itraconazole and •posaconazole; phenobarbital possibly reduces plasma concentration of •voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect)
- Antipsychotics: anticonvulsant effect of barbiturates antagonised by •antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir and •lopinavir; avoidance of phenobarbital advised by manufacturer of etravirine; barbiturates possibly reduce plasma concentration of •indinavir, •nelfinavir and •saquinavir; phenobarbital possibly reduces plasma concentration of •indinavir, also plasma concentration of phenobarbital possibly increased

Anxiolytics and Hypnotics: phenobarbital often reduces plasma concentration of clonazepam
Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant
Beta-blockers: barbiturates reduce plasma concentration of metoprolol and timolol; barbiturates possibly reduce plasma concentration of propranolol
- Calcium-channel Blockers: barbiturates reduce effects of •felodipine and •isradipine; barbiturates probably reduce effects of •dihydropyridines, •diltiazem and •verapamil
- Ciclosporin: barbiturates accelerate metabolism of •ciclosporin (reduced effect)
- Corticosteroids: barbiturates accelerate metabolism of •corticosteroids (reduced effect)

Cytotoxics: avoidance of barbiturates advised by manufacturer of gefitinib; phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: phenobarbital reduces plasma concentration of •eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors

Folates: plasma concentration of phenobarbital possibly reduced by folates
Hormone Antagonists: barbiturates possibly accelerate metabolism of toremifene (reduced plasma concentration)

Barbiturates *(continued)*

Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast

Lofexidine: increased sedative effect when barbiturates given with lofexidine

Memantine: effects of barbiturates possibly reduced by memantine

- Oestrogens: barbiturates accelerate metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Progestogens: barbiturates accelerate metabolism of •progestogens (reduced contraceptive effect—see p. 495)
- Sodium Oxybate: barbiturates enhance effects of •sodium oxybate (avoid concomitant use)

Sympathomimetics: plasma concentration of phenobarbital possibly increased by methylphenidate

- Tacrolimus: phenobarbital reduces plasma concentration of •tacrolimus

Theophylline: barbiturates accelerate metabolism of theophylline (reduced effect)

Thyroid Hormones: barbiturates accelerate metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

Tibolone: barbiturates accelerate metabolism of tibolone (reduced plasma concentration)

- Ulipristal: avoidance of phenobarbital advised by manufacturer of •ulipristal (contraceptive effect of ulipristal possibly reduced)

Vitamins: barbiturates possibly increase requirements for vitamin D

Beclometasone *see* Corticosteroids

Bemiparin *see* Heparins

Bendamustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Bendroflumethiazide *see* Diuretics

Benperidol *see* Antipsychotics

Benzodiazepines *see* Anxiolytics and Hypnotics

Benzthiazide *see* Diuretics

Benzylpenicillin *see* Penicillins

Beta-blockers

Note Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind

ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when beta-blockers given with alcohol

Aldesleukin: enhanced hypotensive effect when beta-blockers given with aldesleukin

- Alpha-blockers: enhanced hypotensive effect when beta-blockers given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with general anaesthetics

- Anaesthetics, Local: propranolol increases risk of •bupivacaine toxicity

Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists

- Anti-arrhythmics: increased myocardial depression when beta-blockers given with •anti-arrhythmics; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with •amiodarone; increased risk of ventricular arrhythmias when sotalol given with •amiodarone, •disopyramide or •dronedarone—avoid concomitant use; plasma concentration of metoprolol and propranolol possibly increased by dronedarone; increased risk of myocardial depression and bradycardia when beta-blockers given with •flecainide; propranolol increases risk of •lidocaine toxicity; plasma concentration of metoprolol and propranolol increased by propafenone

Beta-blockers

- Anti-arrhythmics *(continued)*
- Antibacterials: increased risk of ventricular arrhythmias when sotalol given with •moxifloxacin—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by rifampicin (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by rifampicin
- Antidepressants: plasma concentration of metoprolol increased by citalopram and escitalopram; plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine (enhanced effect); labetalol and propranolol increase plasma concentration of imipramine; enhanced hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with •tricyclics

Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with antidiabetics; beta-blockers enhance hypoglycaemic effect of insulin

- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of metoprolol and sotalol advised by manufacturer of •artemether/lumefantrine; increased risk of bradycardia when beta-blockers given with mefloquine
- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with •droperidol or •zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with •haloperidol—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with •chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with •amisulpride, •phenothiazines, •pimozide or •sulpiride; enhanced hypotensive effect when beta-blockers given with phenothiazines
- Antivirals: increased risk of ventricular arrhythmias when sotalol given with •saquinavir—avoid concomitant use; avoidance of metoprolol for heart failure advised by manufacturer of •tipranavir

Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with anxiolytics and hypnotics

- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with •atomoxetine

Barbiturates: plasma concentration of metoprolol and timolol reduced by barbiturates; plasma concentration of propranolol possibly reduced by barbiturates

- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers given with •nifedipine; increased risk of AV block and bradycardia when beta-blockers given with •diltiazem; asystole, severe hypotension and heart failure when beta-blockers given with •verapamil (see p. 133)

Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides

Beta-blockers *(continued)*
- Ciclosporin: carvedilol increases plasma concentration of •ciclosporin
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with •clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)

Corticosteroids: hypotensive effect of beta-blockers antagonised by corticosteroids
- Cytotoxics: increased risk of ventricular arrhythmias when sotalol given with •arsenic trioxide

Diazoxide: enhanced hypotensive effect when beta-blockers given with diazoxide
- Diuretics: enhanced hypotensive effect when beta-blockers given with diuretics; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by •loop diuretics or •thiazides and related diuretics

Dopaminergics: enhanced hypotensive effect when beta-blockers given with levodopa

Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ergotamine and methysergide

$5HT_1$ Agonists: propranolol increases plasma concentration of rizatriptan (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ivabradine: increased risk of ventricular arrhythmias when sotalol given with •ivabradine

Methyldopa: enhanced hypotensive effect when beta-blockers given with methyldopa
- Moxisylyte: possible severe postural hypotension when beta-blockers given with •moxisylyte

Moxonidine: enhanced hypotensive effect when beta-blockers given with moxonidine

Muscle Relaxants: propranolol enhances effects of muscle relaxants; enhanced hypotensive effect when beta-blockers given with baclofen; possible enhanced hypotensive effect and bradycardia when beta-blockers given with tizanidine

Nitrates: enhanced hypotensive effect when beta-blockers given with nitrates

Oestrogens: hypotensive effect of beta-blockers antagonised by oestrogens

Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers given with pilocarpine

Prostaglandins: enhanced hypotensive effect when beta-blockers given with alprostadil
- Ranolazine: avoidance of sotalol advised by manufacturer of •ranolazine
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •adrenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •dobutamine; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with •noradrenaline (norepinephrine)

Thyroid Hormones: metabolism of propranolol accelerated by levothyroxine

Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by cimetidine

Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with hydralazine, minoxidil or sodium nitroprusside

Betahistine

Antihistamines: effect of betahistine theoretically antagonised by antihistamines

Betamethasone *see* Corticosteroids

Betaxolol *see* Beta-blockers

Bethanechol *see* Parasympathomimetics

Bexarotene

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by •gemfibrozil—avoid concomitant use

Bezafibrate *see* Fibrates

Bicalutamide

Anticoagulants: bicalutamide possibly enhances anticoagulant effect of coumarins

Biguanides *see* Antidiabetics

Bile Acid Sequestrants *see* Colesevelam, Colestipol, and Colestyramine

Bile Acids *see* Ursodeoxycholic Acid

Bisoprolol *see* Beta-blockers

Bisphosphonates

Analgesics: bioavailability of tiludronic acid increased by indometacin

Antacids: absorption of bisphosphonates reduced by antacids

Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with aminoglycosides

Calcium Salts: absorption of bisphosphonates reduced by calcium salts
- Cytotoxics: sodium clodronate increases plasma concentration of •estramustine

Iron: absorption of bisphosphonates reduced by *oral* iron

Bleomycin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased pulmonary toxicity when bleomycin given with •cisplatin

Bortezomib

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: plasma concentration of bortezomib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Bosentan
- Antibacterials: plasma concentration of bosentan reduced by •rifampicin—avoid concomitant use

Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of coumarins
- Antidiabetics: increased risk of hepatotoxicity when bosentan given with •glibenclamide—avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by ketoconazole; plasma concentration of bosentan possibly increased by •fluconazole—avoid concomitant use; plasma concentration of bosentan possibly increased by itraconazole

Antivirals: plasma concentration of bosentan possibly increased by ritonavir
- Ciclosporin: plasma concentration of bosentan increased by •ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)

Lipid-regulating Drugs: bosentan reduces plasma concentration of simvastatin
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing •oestrogens (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing •progestogens (alternative contraception recommended)

Bosentan *(continued)*
Sildenafil: bosentan reduces plasma concentration of sildenafil
Tadalafil: bosentan reduces plasma concentration of tadalafil

Brimonidine
Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Brinzolamide *see* Diuretics

Bromocriptine
Alcohol: tolerance of bromocriptine reduced by alcohol
Antibacterials: plasma concentration of bromocriptine increased by erythromycin (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by macrolides (increased risk of toxicity)
Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by antipsychotics
Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by domperidone
Hormone Antagonists: plasma concentration of bromocriptine increased by octreotide
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by metoclopramide
• Sympathomimetics: risk of toxicity when bromocriptine given with •isometheptene

Buclizine *see* Antihistamines

Budesonide *see* Corticosteroids

Bumetanide *see* Diuretics

Bupivacaine
Anti-arrhythmics: increased myocardial depression when bupivacaine given with anti-arrhythmics
• Beta-blockers: increased risk of bupivacaine toxicity when given with •propranolol

Buprenorphine *see* Opioid Analgesics

Bupropion
• Antidepressants: bupropion possibly increases plasma concentration of citalopram; manufacturer of bupropion advises avoid for 2 weeks after stopping •MAOIs; manufacturer of bupropion advises avoid concomitant use with •moclobemide; bupropion possibly increases plasma concentration of tricyclics (possible increased risk of convulsions)
Antiepileptics: plasma concentration of bupropion reduced by carbamazepine and phenytoin; metabolism of bupropion inhibited by valproate
Antivirals: plasma concentration of bupropion reduced by ritonavir
Atomoxetine: possible increased risk of convulsions when bupropion given with atomoxetine
Dopaminergics: increased risk of side-effects when bupropion given with amantadine or levodopa
• Hormone Antagonists: bupropion possibly inhibits metabolism of •tamoxifen to active metabolite (avoid concomitant use)

Buspirone *see* Anxiolytics and Hypnotics

Busulfan
Analgesics: metabolism of *intravenous* busulfan possibly inhibited by paracetamol (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)
• Antibacterials: plasma concentration of busulfan increased by •metronidazole (increased risk of toxicity)
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of busulfan possibly reduced by phenytoin
Antifungals: metabolism of busulfan inhibited by itraconazole (increased risk of toxicity)
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Busulfan *(continued)*
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: increased risk of hepatotoxicity when busulfan given with tioguanine

Butobarbital *see* Barbiturates

Butyrophenones *see* Antipsychotics

Cabergoline
Antibacterials: plasma concentration of cabergoline increased by erythromycin (increased risk of toxicity); plasma concentration of cabergoline possibly increased by macrolides (increased risk of toxicity)
Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by antipsychotics
Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by domperidone
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by metoclopramide

Calcium Salts
Note *see also* Antacids
Antibacterials: calcium salts reduce absorption of ciprofloxacin and tetracycline
Bisphosphonates: calcium salts reduce absorption of bisphosphonates
Cardiac Glycosides: large *intravenous* doses of calcium salts can precipitate arrhythmias when given with cardiac glycosides
Corticosteroids: absorption of calcium salts reduced by corticosteroids
Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics
Eltrombopag: calcium salts possibly reduce absorption of eltrombopag (give at least 4 hours apart)
Fluorides: calcium salts reduce absorption of fluorides
Iron: calcium salts reduce absorption of *oral* iron
Thyroid Hormones: calcium salts reduce absorption of levothyroxine
Zinc: calcium salts reduce absorption of zinc

Calcium-channel Blockers
Note Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine
ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol
Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with aldesleukin
Aliskiren: avoidance of verapamil advised by manufacturer of aliskiren
• Alpha-blockers: enhanced hypotensive effect when calcium-channel blockers given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
• Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with general anaesthetics or isoflurane; hypotensive effect of verapamil enhanced by •general anaesthetics (also AV delay)
Analgesics: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression)
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists
• Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or

Calcium-channel Blockers

- Anti-arrhythmics *(continued)*
  verapamil given with ●amiodarone; increased risk of myocardial depression and asystole when verapamil given with ●disopyramide or ●flecainide; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with ●dronedarone; nifedipine increases plasma concentration of ●dronedarone
- Antibacterials: metabolism of verapamil possibly inhibited by ●clarithromycin and ●erythromycin (increased risk of toxicity); metabolism of felodipine possibly inhibited by erythromycin (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with erythromycin; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by ●rifampicin (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by ●rifampicin (possible significantly reduced plasma concentration)
- Anticoagulants: verapamil possibly increases plasma concentration of ●dabigatran etexilate (reduce dose of dabigatran etexilate)
- Antidepressants: metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of imipramine; enhanced hypotensive effect when calcium-channel blockers given with MAOIs; plasma concentration of verapamil significantly reduced by ●St John's wort; plasma concentration of nifedipine reduced by St John's wort; plasma concentration of amlodipine possibly reduced by St John's wort; diltiazem and verapamil possibly increase plasma concentration of tricyclics

  Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with insulin
- Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine probably reduced by carbamazepine; diltiazem and verapamil enhance effects of ●carbamazepine; effects of felodipine and isradipine reduced by carbamazepine; effects of felodipine, isradipine and verapamil reduced by phenytoin; effects of dihydropyridines, nicardipine and nifedipine probably reduced by ●phenytoin; diltiazem increases plasma concentration of ●phenytoin but also effect of diltiazem reduced; effects of felodipine and isradipine reduced by ●primidone; effects of dihydropyridines, diltiazem and verapamil probably reduced by ●primidone
- Antifungals: metabolism of dihydropyridines possibly inhibited by itraconazole and ketoconazole (increased plasma concentration); metabolism of felodipine inhibited by ●itraconazole and ●ketoconazole (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with itraconazole and ketoconazole; negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; plasma concentration of nifedipine increased by micafungin

  Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with mefloquine

  Antimuscarinics: avoidance of verapamil advised by manufacturer of darifenacin

  Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with antipsychotics
- Antivirals: plasma concentration of diltiazem increased by ●atazanavir (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by ●ritonavir; manufacturer of lercanidipine advises avoid concomitant use with ritonavir

Calcium-channel Blockers *(continued)*

Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with anxiolytics and hypnotics; diltiazem and verapamil inhibit metabolism of midazolam (increased plasma concentration with increased sedation); absorption of lercanidipine increased by midazolam; diltiazem and verapamil increase plasma concentration of buspirone (reduce dose of buspirone)

Aprepitant: plasma concentration of both drugs may increase when diltiazem given with aprepitant

- Barbiturates: effects of dihydropyridines, diltiazem and verapamil probably reduced by ●barbiturates; effects of felodipine and isradipine reduced by ●barbiturates
- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia when diltiazem given with ●beta-blockers; asystole, severe hypotension and heart failure when verapamil given with ●beta-blockers (see p. 133); possible severe hypotension and heart failure when nifedipine given with ●beta-blockers

  Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with nifedipine
- Cardiac Glycosides: diltiazem, lercanidipine and nicardipine increase plasma concentration of ●digoxin; verapamil increases plasma concentration of ●digoxin, also increased risk of AV block and bradycardia; nifedipine possibly increases plasma concentration of ●digoxin
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ●ciclosporin; combination of lercanidipine with ●ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyperplasia)

  Cilostazol: diltiazem increases plasma concentration of cilostazol (consider reducing dose of cilostazol)

  Clonidine: enhanced hypotensive effect when calcium-channel blockers given with clonidine
- Colchicine: diltiazem and verapamil possibly increase risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

  Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by corticosteroids; diltiazem increases plasma concentration of methylprednisolone
- Cytotoxics: plasma concentration of both drugs may increase when verapamil given with ●everolimus; nifedipine possibly inhibits metabolism of vincristine

  Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide

  Diuretics: enhanced hypotensive effect when calcium-channel blockers given with diuretics; diltiazem and verapamil increase plasma concentration of eplerenone (reduce dose of eplerenone)

  Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with levodopa

  Grapefruit Juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by grapefruit juice; plasma concentration of amlodipine possibly increased by grapefruit juice

  Hormone Antagonists: diltiazem and verapamil increase plasma concentration of dutasteride
- Ivabradine: diltiazem and verapamil increase plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: diltiazem increases plasma concentration of atorvastatin and simvastatin—possible increased risk of myopathy; increased risk of myopathy when verapamil given with ●simvastatin;

Calcium-channel Blockers

- Lipid-regulating Drugs *(continued)*
  possible increased risk of myopathy when amlodipine given with simvastatin
  Lithium: neurotoxicity may occur when diltiazem or verapamil given with lithium without increased plasma concentration of lithium
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and ●parenteral magnesium in pre-eclampsia
  Methyldopa: enhanced hypotensive effect when calcium-channel blockers given with methyldopa
  Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with moxisylyte
  Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with moxonidine
  Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypotensive effect when calcium-channel blockers given with baclofen or tizanidine; hypotension, myocardial depression, and hyperkalaemia when verapamil given with *intravenous* dantrolene; possible increased risk of ventricular arrhythmias when diltiazem given with *intravenous* dantrolene—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of non-depolarising muscle relaxants
  Nitrates: enhanced hypotensive effect when calcium-channel blockers given with nitrates
  Oestrogens: hypotensive effect of calcium-channel blockers antagonised by oestrogens
  Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with alprostadil
  Ranolazine: diltiazem and verapamil increase plasma concentration of ranolazine (consider reducing dose of ranolazine)
  Sildenafil: enhanced hypotensive effect when amlodipine given with sildenafil
- Sirolimus: diltiazem increases plasma concentration of ●sirolimus; plasma concentration of both drugs increased when verapamil given with ●sirolimus
- Tacrolimus: diltiazem and nifedipine increase plasma concentration of ●tacrolimus; felodipine, nicardipine and verapamil possibly increase plasma concentration of tacrolimus
- Theophylline: calcium-channel blockers possibly increase plasma concentration of ●theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of ●theophylline (enhanced effect)
  Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration); plasma concentration of isradipine increased by cimetidine (halve dose of isradipine)
  Vardenafil: enhanced hypotensive effect when nifedipine given with vardenafil
  Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil or sodium nitroprusside

Calcium-channel Blockers (dihydropyridines) *see* Calcium-channel Blockers

Candesartan *see* Angiotensin-II Receptor Antagonists

Cannabis Extract

Antidepressants: possible increased risk of hypertension and tachycardia when cannabis extract given with tricyclics

Capecitabine *see* Fluorouracil

Capreomycin

Antibacterials: increased risk of nephrotoxicity when capreomycin given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when capreomycin given with aminoglycosides or vancomycin

Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with platinum compounds

Capreomycin *(continued)*

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Captopril *see* ACE Inhibitors

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by alcohol

- Analgesics: effects of carbamazepine enhanced by ●dextropropoxyphene; carbamazepine reduces plasma concentration of methadone; carbamazepine reduces effects of tramadol; carbamazepine possibly accelerates metabolism of paracetamol
- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of ●dronedarone—avoid concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by ●clarithromycin and ●erythromycin; plasma concentration of carbamazepine reduced by ●rifabutin; carbamazepine accelerates metabolism of doxycycline (reduced effect); plasma concentration of carbamazepine increased by ●isoniazid (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after carbamazepine)
- Anticoagulants: carbamazepine accelerates metabolism of ●coumarins (reduced anticoagulant effect)
- Antidepressants: plasma concentration of carbamazepine increased by ●fluoxetine and ●fluvoxamine; carbamazepine reduces plasma concentration of ●mianserin and mirtazapine; manufacturer of carbamazepine advises avoid for 2 weeks after stopping ●MAOIs, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort; carbamazepine accelerates metabolism of ●tricyclics (reduced plasma concentration and reduced effect)
- Antiepileptics: plasma concentration of both drugs reduced when carbamazepine given with eslicarbazepine; carbamazepine possibly reduces plasma concentration of ethosuximide; carbamazepine often reduces plasma concentration of lamotrigine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with levetiracetam; plasma concentration of carbamazepine sometimes reduced by oxcarbazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; plasma concentration of both drugs often reduced when carbamazepine given with phenytoin, also plasma concentration of phenytoin may be increased; plasma concentration of carbamazepine often reduced by primidone, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); plasma concentration of both drugs possibly reduced when carbamazepine given with rufinamide; plasma concentration of carbamazepine increased by ●stiripentol; carbamazepine reduces plasma concentration of tiagabine and zonisamide; carbamazepine often reduces plasma concentration of topiramate; carbamazepine reduces plasma concentration of valproate, also plasma concentration of active metabolite of carbamazepine increased
- Antifungals: plasma concentration of carbamazepine possibly increased by fluconazole, ketoconazole and miconazole; carbamazepine possibly reduces plasma concentration of itraconazole and ●posaconazole; carbamazepine possibly reduces plasma concentration of ●voriconazole—avoid concomitant use;

Carbamazepine

- Antifungals *(continued)*
  carbamazepine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of carbamazepine antagonised by ●antipsychotics (convulsive threshold lowered); carbamazepine accelerates metabolism of haloperidol, olanzapine, quetiapine and risperidone (reduced plasma concentration); carbamazepine reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole; carbamazepine accelerates metabolism of ●clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of paliperidone
- Antivirals: carbamazepine possibly reduces plasma concentration of darunavir, fosamprenavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of both drugs reduced when carbamazepine given with efavirenz; avoidance of carbamazepine advised by manufacturer of etravirine; carbamazepine possibly reduces plasma concentration of ●indinavir, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of nevirapine; plasma concentration of carbamazepine possibly increased by ●ritonavir

  Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of clonazepam; carbamazepine reduces plasma concentration of midazolam

  Aprepitant: carbamazepine possibly reduces plasma concentration of aprepitant

  Barbiturates: plasma concentration of carbamazepine reduced by phenobarbital

  Bupropion: carbamazepine reduces plasma concentration of bupropion
- Calcium-channel Blockers: carbamazepine reduces effects of felodipine and isradipine; carbamazepine probably reduces effects of dihydropyridines, nicardipine and nifedipine; effects of carbamazepine enhanced by ●diltiazem and ●verapamil
- Ciclosporin: carbamazepine accelerates metabolism of ●ciclosporin (reduced plasma concentration)
- Clopidogrel: carbamazepine possibly reduces antiplatelet effect of ●clopidogrel
- Corticosteroids: carbamazepine accelerates metabolism of ●corticosteroids (reduced effect)
- Cytotoxics: avoidance of carbamazepine advised by manufacturer of gefitinib; carbamazepine reduces plasma concentration of ●imatinib and ●lapatinib—avoid concomitant use; carbamazepine reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: increased risk of hyponatraemia when carbamazepine given with diuretics; plasma concentration of carbamazepine increased by ●acetazolamide; carbamazepine reduces plasma concentration of ●eplerenone—avoid concomitant use
- Hormone Antagonists: metabolism of carbamazepine inhibited by ●danazol (increased risk of toxicity); carbamazepine possibly accelerates metabolism of toremifene (reduced plasma concentration)

  $5HT_3$ Antagonists: carbamazepine accelerates metabolism of ondansetron (reduced effect)
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of ●simvastatin—consider increasing dose of simvastatin

  Lithium: neurotoxicity may occur when carbamazepine given with lithium without increased plasma concentration of lithium

Carbamazepine *(continued)*

Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)

- Oestrogens: carbamazepine accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: carbamazepine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 495)

Retinoids: plasma concentration of carbamazepine possibly reduced by isotretinoin

Theophylline: carbamazepine accelerates metabolism of theophylline (reduced effect)

Thyroid Hormones: carbamazepine accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

Tibolone: carbamazepine accelerates metabolism of tibolone (reduced plasma concentration)

- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by ●cimetidine (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of ●ulipristal (contraceptive effect of ulipristal possibly reduced)

Vitamins: carbamazepine possibly increases requirements for vitamin D

Carbapenems *see* Doripenem, Ertapenem, Imipenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors *see* Diuretics

Carboplatin *see* Platinum Compounds

Carboprost *see* Prostaglandins

Cardiac Glycosides

ACE Inhibitors: plasma concentration of digoxin possibly increased by captopril

Alpha-blockers: plasma concentration of digoxin increased by prazosin

Aminosalicylates: absorption of digoxin possibly reduced by sulfasalazine

Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function

Antacids: absorption of digoxin possibly reduced by antacids

- Anti-arrhythmics: plasma concentration of digoxin increased by ●amiodarone, ●dronedarone and ●propafenone (halve dose of digoxin)

Antibacterials: plasma concentration of digoxin possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin possibly reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antidepressants: plasma concentration of digoxin reduced by ●St John's wort—avoid concomitant use

Antidiabetics: plasma concentration of digoxin possibly reduced by acarbose; plasma concentration of digoxin increased by sitagliptin

Antiepileptics: plasma concentration of digoxin possibly reduced by phenytoin

- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ●amphotericin; plasma concentration of digoxin increased by ●itraconazole
- Antimalarials: plasma concentration of digoxin possibly increased by ●chloroquine and hydroxychloroquine; possible increased risk of bradycardia when digoxin given with mefloquine; plasma concentration of digoxin increased by ●quinine

Antimuscarinics: plasma concentration of digoxin possibly increased by darifenacin

Cardiac Glycosides *(continued)*
Antivirals: plasma concentration of digoxin increased by etravirine; plasma concentration of digoxin possibly increased by ritonavir
Anxiolytics and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)
Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers
Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large *intravenous* doses of calcium salts
- Calcium-channel Blockers: plasma concentration of digoxin increased by •diltiazem, •lercanidipine and •nicardipine; plasma concentration of digoxin possibly increased by •nifedipine; plasma concentration of digoxin increased by •verapamil, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by •ciclosporin (increased risk of toxicity)
- Colchicine: possible increased risk of myopathy when digoxin given with •colchicine

Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids
Cytotoxics: absorption of digoxin tablets reduced by cytotoxics
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with •acetazolamide, •loop diuretics or •thiazides and related diuretics; plasma concentration of digoxin possibly increased by potassium canrenoate; plasma concentration of digoxin increased by •spironolactone

Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide
Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by colestipol and colestyramine; plasma concentration of digoxin possibly increased by atorvastatin
Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine
Penicillamine: plasma concentration of digoxin possibly reduced by penicillamine
Ranolazine: plasma concentration of digoxin increased by ranolazine
Sympathomimetics, $Beta_2$: plasma concentration of digoxin possibly reduced by salbutamol
Tolvaptan: plasma concentration of digoxin increased by tolvaptan (increased risk of toxicity)
Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhibitors; absorption of cardiac glycosides possibly reduced by sucralfate

Carmustine
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by cimetidine

Carteolol *see* Beta-blockers

Carvedilol *see* Beta-blockers

Caspofungin
Antibacterials: plasma concentration of caspofungin initially increased and then reduced by rifampicin (consider increasing dose of caspofungin)
Antiepileptics: plasma concentration of caspofungin possibly reduced by carbamazepine and phenytoin—consider increasing dose of caspofungin
Antivirals: plasma concentration of caspofungin possibly reduced by efavirenz and nevirapine—consider increasing dose of caspofungin

Caspofungin *(continued)*
- Ciclosporin: plasma concentration of caspofungin increased by •ciclosporin (manufacturer of caspofungin recommends monitoring liver enzymes)

Corticosteroids: plasma concentration of caspofungin possibly reduced by dexamethasone—consider increasing dose of caspofungin
- Tacrolimus: caspofungin reduces plasma concentration of •tacrolimus

Cefaclor *see* Cephalosporins

Cefadroxil *see* Cephalosporins

Cefalexin *see* Cephalosporins

Cefixime *see* Cephalosporins

Cefotaxime *see* Cephalosporins

Cefpodoxime *see* Cephalosporins

Cefradine *see* Cephalosporins

Ceftazidime *see* Cephalosporins

Ceftriaxone *see* Cephalosporins

Cefuroxime *see* Cephalosporins

Celecoxib *see* NSAIDs

Celiprolol *see* Beta-blockers

Cephalosporins
Antacids: absorption of cefaclor and cefpodoxime reduced by antacids
Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with aminoglycosides
- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of •coumarins

Probenecid: excretion of cephalosporins reduced by probenecid (increased plasma concentration)
Ulcer-healing Drugs: absorption of cefpodoxime reduced by histamine H_2-antagonists
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Certolizumab pegol
- Abatacept: avoid concomitant use of certolizumab pegol with •abatacept
- Anakinra: avoid concomitant use of certolizumab pegol with •anakinra
- Vaccines: avoid concomitant use of certolizumab pegol with live •vaccines (see p. 746)

Cetirizine *see* Antihistamines

Chloral *see* Anxiolytics and Hypnotics

Chloramphenicol
Antibacterials: metabolism of chloramphenicol accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: chloramphenicol enhances anticoagulant effect of •coumarins
- Antidiabetics: chloramphenicol enhances effects of •sulfonylureas
- Antiepileptics: chloramphenicol increases plasma concentration of •phenytoin (increased risk of toxicity); metabolism of chloramphenicol accelerated by •primidone (reduced plasma concentration)
- Antipsychotics: avoid concomitant use of chloramphenicol with •clozapine (increased risk of agranulocytosis)
- Barbiturates: metabolism of chloramphenicol accelerated by •barbiturates (reduced plasma concentration)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of •ciclosporin
- Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of •clopidogrel

Hydroxocobalamin: chloramphenicol reduces response to hydroxocobalamin
- Tacrolimus: chloramphenicol possibly increases plasma concentration of •tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Chlordiazepoxide *see* Anxiolytics and Hypnotics

Chloroquine and Hydroxychloroquine
Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by kaolin
Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of

Chloroquine and Hydroxychloroquine

Agalsidase Alfa and Beta *(continued)*
agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with •amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with •moxifloxacin—avoid concomitant use

Antiepileptics: possible increased risk of convulsions when chloroquine and hydroxychloroquine given with antiepileptics

- Antimalarials: avoidance of antimalarials advised by manufacturer of •artemether/lumefantrine; increased risk of convulsions when chloroquine and hydroxychloroquine given with •mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with •droperidol—avoid concomitant use
- Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of •digoxin
- Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of •ciclosporin (increased risk of toxicity)

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by lanthanum (give at least 2 hours apart)

Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of laronidase (manufacturer of laronidase advises avoid concomitant use)

Parasympathomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by cimetidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Chlorothiazide *see* Diuretics

Chlorphenamine *see* Antihistamines

Chlorpromazine *see* Antipsychotics

Chlortalidone *see* Diuretics

Ciclesonide *see* Corticosteroids

Ciclosporin

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with •ACE inhibitors
- Aliskiren: ciclosporin increases plasma concentration of •aliskiren—avoid concomitant use

Allopurinol: plasma concentration of ciclosporin possibly increased by allopurinol (risk of nephrotoxicity)

- Analgesics: increased risk of nephrotoxicity when ciclosporin given with •NSAIDs; ciclosporin increases plasma concentration of •diclofenac (halve dose of diclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with •angiotensin-II receptor antagonists

Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone

- Antibacterials: metabolism of ciclosporin inhibited by •clarithromycin and •erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by •rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by •sulfadiazine; plasma concentration of ciclosporin possibly increased by •chloramphenicol, •doxycycline and •telithromycin; increased risk of nephrotoxicity when ciclosporin given with •aminoglycosides, •polymyxins, •quinolones, •sulfonamides or •vancomycin; increased risk of myopathy when ciclosporin given with •daptomycin (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by •macrolides (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with •trimethoprim, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim
- Antidepressants: plasma concentration of ciclosporin reduced by •St John's wort—avoid concomitant use

Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide

- Antiepileptics: metabolism of ciclosporin accelerated by •carbamazepine and •phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine; metabolism of ciclosporin accelerated by •primidone (reduced effect)
- Antifungals: metabolism of ciclosporin inhibited by •fluconazole, •itraconazole, •ketoconazole, •posaconazole and •voriconazole (increased plasma concentration); metabolism of ciclosporin possibly inhibited by •miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with •amphotericin; ciclosporin increases plasma concentration of •caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by griseofulvin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin
- Antimalarials: plasma concentration of ciclosporin increased by •chloroquine and hydroxychloroquine (increased risk of toxicity)

Antimuscarinics: avoidance of ciclosporin advised by manufacturer of darifenacin

- Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by •atazanavir, •nelfinavir and •ritonavir; plasma concentration of ciclosporin possibly reduced by •efavirenz; plasma concentration of ciclosporin increased by •fosamprenavir and •indinavir; plasma concentration of both drugs increased when ciclosporin given with •saquinavir
- Barbiturates: metabolism of ciclosporin accelerated by •barbiturates (reduced effect)
- Beta-blockers: plasma concentration of ciclosporin increased by •carvedilol
- Bile Acids: absorption of ciclosporin increased by •ursodeoxycholic acid
- Bosentan: ciclosporin increases plasma concentration of •bosentan (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with •lercanidipine may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by •diltiazem, •nicardipine and •verapamil; ciclosporin possibly increases plasma concentration of nifedipine (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of •digoxin (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with •colchicine—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose •methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of prednisolone
- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with •melphalan; increased risk of

Ciclosporin

- Cytotoxics *(continued)*
  neurotoxicity when ciclosporin given with •doxorubicin; ciclosporin increases plasma concentration of •epirubicin, •everolimus and •idarubicin; ciclosporin reduces excretion of mitoxantrone (increased plasma concentration); risk of toxicity when ciclosporin given with •methotrexate; plasma concentration of ciclosporin possibly increased by imatinib; *in vitro* studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)
- Diuretics: plasma concentration of ciclosporin possibly increased by •acetazolamide; increased risk of hyperkalaemia when ciclosporin given with •potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics
- Grapefruit Juice: plasma concentration of ciclosporin increased by •grapefruit juice (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by •danazol (increased plasma concentration); plasma concentration of ciclosporin reduced by lanreotide and •octreotide
- Lipid-regulating Drugs: absorption of ciclosporin reduced by •colesevelam; increased risk of renal impairment when ciclosporin given with bezafibrate or fenofibrate; increased risk of myopathy when ciclosporin given with •rosuvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with •ezetimibe; increased risk of myopathy when ciclosporin given with •statins
  Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with mannitol
- Metoclopramide: plasma concentration of ciclosporin increased by •metoclopramide
  Mifamurtide: avoidance of ciclosporin advised by manufacturer of mifamurtide
- Modafinil: plasma concentration of ciclosporin reduced by •modafinil
  Oestrogens: plasma concentration of ciclosporin possibly increased by oestrogens
- Orlistat: absorption of ciclosporin possibly reduced by •orlistat
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with •potassium salts
- Progestogens: metabolism of ciclosporin inhibited by •progestogens (increased plasma concentration)
  Ranolazine: ciclosporin possibly increases plasma concentration of ranolazine
  Sevelamer: plasma concentration of ciclosporin possibly reduced by sevelamer
  Sirolimus: ciclosporin increases plasma concentration of sirolimus
- Sitaxentan: ciclosporin increases plasma concentration of •sitaxentan—avoid concomitant use
- Sulfinpyrazone: plasma concentration of ciclosporin reduced by •sulfinpyrazone
- Tacrolimus: plasma concentration of ciclosporin increased by •tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by •cimetidine; plasma concentration of ciclosporin possibly affected by omeprazole
  Vitamins: plasma concentration of ciclosporin possibly affected by vitamin E

Cidofovir

- Antivirals: manufacturers advise avoid concomitant use of cidofovir with •tenofovir

Cilazapril *see* ACE Inhibitors

Cilostazol

- Anagrelide: avoidance of cilostazol advised by manufacturer of •anagrelide
  Antibacterials: plasma concentration of cilostazol increased by erythromycin (consider reducing dose of cilostazol)
  Antifungals: plasma concentration of cilostazol increased by ketoconazole (consider reducing dose of cilostazol)
  Calcium-channel Blockers: plasma concentration of cilostazol increased by diltiazem (consider reducing dose of cilostazol)
  Ulcer-healing Drugs: plasma concentration of cilostazol increased by omeprazole (consider reducing dose of cilostazol)

Cimetidine *see* Histamine H_2-antagonists

Cinacalcet

Antifungals: metabolism of cinacalcet inhibited by ketoconazole (increased plasma concentration)

- Hormone Antagonists: cinacalcet possibly inhibits metabolism of •tamoxifen to active metabolite (avoid concomitant use)

Cinnarizine *see* Antihistamines

Ciprofibrate *see* Fibrates

Ciprofloxacin *see* Quinolones

Cisatracurium *see* Muscle Relaxants

Cisplatin *see* Platinum Compounds

Citalopram *see* Antidepressants, SSRI

Clarithromycin *see* Macrolides

Clemastine *see* Antihistamines

Clindamycin

- Muscle Relaxants: clindamycin enhances effects of •non-depolarising muscle relaxants and •suxamethonium
  Parasympathomimetics: clindamycin antagonises effects of neostigmine and pyridostigmine
  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Clobazam *see* Anxiolytics and Hypnotics

Clomethiazole *see* Anxiolytics and Hypnotics

Clomipramine *see* Antidepressants, Tricyclic

Clonazepam *see* Anxiolytics and Hypnotics

Clonidine

ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of captopril
Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when clonidine given with alcohol
Aldesleukin: enhanced hypotensive effect when clonidine given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when clonidine given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when clonidine given with general anaesthetics
Analgesics: hypotensive effect of clonidine antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with angiotensin-II receptor antagonists

- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine antagonised by •tricyclics, also increased risk of hypertension on clonidine withdrawal
  Antipsychotics: enhanced hypotensive effect when clonidine given with phenothiazines
  Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with anxiolytics and hypnotics
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with •beta-blockers (withdraw beta-blockers several days before slowly withdrawing clonidine)

Clonidine *(continued)*
Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with calcium-channel blockers
Corticosteroids: hypotensive effect of clonidine antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when clonidine given with diazoxide
Diuretics: enhanced hypotensive effect when clonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when clonidine given with levodopa
Histamine: avoidance of clonidine advised by manufacturer of histamine
Methyldopa: enhanced hypotensive effect when clonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when clonidine given with moxisylyte
Moxonidine: enhanced hypotensive effect when clonidine given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when clonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when clonidine given with nitrates
Oestrogens: hypotensive effect of clonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when clonidine given with alprostadil
- Sympathomimetics: possible risk of hypertension when clonidine given with adrenaline (epinephrine) or noradrenaline (norepinephrine); serious adverse events reported with concomitant use of clonidine and •methylphenidate (causality not established)

Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with hydralazine, minoxidil or sodium nitroprusside

Clopamide *see* Diuretics

Clopidogrel
Analgesics: increased risk of bleeding when clopidogrel given with NSAIDs or aspirin
- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by •chloramphenicol, •ciprofloxacin and •erythromycin
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with •warfarin; antiplatelet action of clopidogrel enhances anticoagulant effect of •coumarins and •phenindione; increased risk of bleeding when clopidogrel given with heparins
- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by •fluoxetine, •fluvoxamine and •moclobemide
- Antiepileptics: antiplatelet effect of clopidogrel possibly reduced by •carbamazepine and •oxcarbazepine
- Antifungals: antiplatelet effect of clopidogrel possibly reduced by •fluconazole, •itraconazole, •ketoconazole and •voriconazole
- Antivirals: antiplatelet effect of clopidogrel possibly reduced by •etravirine

Dipyridamole: increased risk of bleeding when clopidogrel given with dipyridamole
Iloprost: increased risk of bleeding when clopidogrel given with iloprost
Prasugrel: possible increased risk of bleeding when clopidogrel given with prasugrel
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by •cimetidine, lansoprazole, pantoprazole and rabeprazole; antiplatelet effect of clopidogrel reduced by •esomeprazole and •omeprazole

Clotrimazole *see* Antifungals, Imidazole

Clozapine *see* Antipsychotics

Co-amoxiclav *see* Penicillins

Co-beneldopa *see* Levodopa

Co-careldopa *see* Levodopa

Codeine *see* Opioid Analgesics

Co-fluampicil *see* Penicillins

Colchicine
- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with •amiodarone
- Antibacterials: possible increased risk of colchicine toxicity when given with •azithromycin, •clarithromycin, •erythromycin and •telithromycin—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with •itraconazole and •ketoconazole—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with •atazanavir, •indinavir and •ritonavir—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with •diltiazem and •verapamil—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with •digoxin
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with •ciclosporin—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with •grapefruit juice
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with •fibrates or •statins

Colesevelam
Note Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption
Antidiabetics: colesevelam reduces absorption of glibenclamide
Antiepileptics: colesevelam possibly reduces absorption of phenytoin
- Ciclosporin: colesevelam reduces absorption of •ciclosporin

Oestrogens: colesevelam reduces absorption of ethinylestradiol
Thyroid Hormones: colesevelam reduces absorption of levothyroxine

Colestipol
Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption
Antibacterials: colestipol possibly reduces absorption of tetracycline
Bile Acids: colestipol possibly reduces absorption of bile acids
Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
Diuretics: colestipol reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
Thyroid Hormones: colestipol reduces absorption of thyroid hormones

Colestyramine
Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption
Analgesics: colestyramine increases the excretion of meloxicam; colestyramine reduces absorption of paracetamol
Antibacterials: colestyramine possibly reduces absorption of tetracycline; colestyramine antagonises effects of *oral* vancomycin
- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of •coumarins and •phenindione

Colestyramine *(continued)*

Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of acarbose

Antiepileptics: colestyramine possibly reduces absorption of valproate

Bile Acids: colestyramine possibly reduces absorption of bile acids

Cardiac Glycosides: colestyramine possibly reduces absorption of cardiac glycosides

Diuretics: colestyramine reduces absorption of thiazides and related diuretics (give at least 2 hours apart)

Leflunomide: colestyramine significantly decreases effect of leflunomide (enhanced elimination)—avoid unless drug elimination desired

Mycophenolate: colestyramine reduces absorption of mycophenolate

Raloxifene: colestyramine reduces absorption of raloxifene (manufacturer of raloxifene advises avoid concomitant administration)

Thyroid Hormones: colestyramine reduces absorption of thyroid hormones

Colistin *see* Polymyxins

Contraceptives, oral *see* Oestrogens and Progestogens

Corticosteroids

Note Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified

ACE Inhibitors: corticosteroids antagonise hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of adrenergic neurone blockers

- Aldesleukin: avoidance of corticosteroids advised by manufacturer of ●aldesleukin

Alpha-blockers: corticosteroids antagonise hypotensive effect of alpha-blockers

Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with aspirin, also corticosteroids reduce plasma concentration of salicylate

Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of angiotensin-II receptor antagonists

Antacids: absorption of deflazacort reduced by antacids

- Antibacterials: plasma concentration of methylprednisolone possibly increased by clarithromycin; metabolism of corticosteroids possibly inhibited by erythromycin; metabolism of methylprednisolone inhibited by erythromycin; corticosteroids possibly reduce plasma concentration of isoniazid; metabolism of corticosteroids accelerated by ●rifamycins (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ●coumarins (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of phenindione

Antidiabetics: corticosteroids antagonise hypoglycaemic effect of antidiabetics

- Antiepileptics: metabolism of corticosteroids accelerated by ●carbamazepine, ●phenytoin and ●primidone (reduced effect)
- Antifungals: metabolism of corticosteroids possibly inhibited by itraconazole and ketoconazole; plasma concentration of active metabolite of ciclesonide increased by ketoconazole; plasma concentration of *inhaled* mometasone increased by ketoconazole; plasma concentration of *inhaled* and *oral* budesonide increased by ketoconazole; metabolism of methylprednisolone inhibited by ketoconazole; increased risk of hypokalaemia when corticosteroids given with ●amphotericin—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of *inhaled* budesonide increased by itraconazole; metabolism of methylprednisolone possibly inhibited by itraconazole; dexamethasone possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of indinavir, lopinavir and saquinavir; plasma concentration of *inhaled* and *intranasal* fluticasone possibly increased by nelfinavir; plasma concentration of corticosteroids, dexamethasone and prednisolone possibly increased by ritonavir; plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone increased by ●ritonavir

Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by aprepitant (reduce dose of dexamethasone and methylprednisolone)

- Barbiturates: metabolism of corticosteroids accelerated by ●barbiturates (reduced effect)

Beta-blockers: corticosteroids antagonise hypotensive effect of beta-blockers

Calcium Salts: corticosteroids reduce absorption of calcium salts

Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of calcium-channel blockers; plasma concentration of methylprednisolone increased by diltiazem

Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides

- Ciclosporin: high-dose methylprednisolone increases plasma concentration of ●ciclosporin (risk of convulsions); plasma concentration of prednisolone increased by ciclosporin

Clonidine: corticosteroids antagonise hypotensive effect of clonidine

Diazoxide: corticosteroids antagonise hypotensive effect of diazoxide

Diuretics: corticosteroids antagonise diuretic effect of diuretics; increased risk of hypokalaemia when corticosteroids given with acetazolamide, loop diuretics or thiazides and related diuretics

Histamine: avoidance of corticosteroids advised by manufacturer of histamine

Methyldopa: corticosteroids antagonise hypotensive effect of methyldopa

Mifamurtide: avoidance of corticosteroids advised by manufacturer of mifamurtide

Mifepristone: effect of corticosteroids (including *inhaled* corticosteroids) may be reduced for 3–4 days after mifepristone

Moxonidine: corticosteroids antagonise hypotensive effect of moxonidine

Muscle Relaxants: corticosteroids possibly antagonise effects of pancuronium and vecuronium

Nitrates: corticosteroids antagonise hypotensive effect of nitrates

Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing oestrogens

Sodium Benzoate: corticosteroids possibly reduce effects of sodium benzoate

Sodium Phenylbutyrate: corticosteroids possibly reduce effects of sodium phenylbutyrate

Somatropin: corticosteroids may inhibit growth-promoting effect of somatropin

Sympathomimetics: metabolism of dexamethasone accelerated by ephedrine

Sympathomimetics, $Beta_2$: increased risk of hypokalaemia when corticosteroids given with high doses of $beta_2$ sympathomimetics—see Hypokalaemia, p. 176

Theophylline: increased risk of hypokalaemia when corticosteroids given with theophylline

- Vaccines: high doses of corticosteroids impair immune response to ●vaccines, avoid concomitant use with live vaccines (see p. 746)

Corticosteroids *(continued)*

Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Cortisone *see* Corticosteroids

Co-trimoxazole *see* Trimethoprim and Sulfamethoxazole

Coumarins

Note Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of ●alcohol

Allopurinol: anticoagulant effect of coumarins possibly enhanced by allopurinol

- Anabolic Steroids: anticoagulant effect of coumarins enhanced by ●anabolic steroids
- Analgesics: anticoagulant effect of coumarins possibly enhanced by ●NSAIDs; increased risk of haemorrhage when anticoagulants given with *intravenous* ●diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ●ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by ●tramadol; increased risk of bleeding when coumarins given with ●aspirin (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of paracetamol
- Anti-arrhythmics: metabolism of coumarins inhibited by ●amiodarone (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by ●propafenone
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with ●neomycin (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by ●azithromycin, ●aztreonam, ●cephalosporins, levofloxacin, ●tetracyclines, tigecycline and trimethoprim; anticoagulant effect of coumarins enhanced by ●chloramphenicol, ●ciprofloxacin, ●clarithromycin, ●erythromycin, ●metronidazole, ●nalidixic acid, ●norfloxacin, ●ofloxacin and ●sulfonamides; studies have failed to demonstrate an interaction with coumarins, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin; metabolism of coumarins accelerated by ●rifamycins (reduced anticoagulant effect)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by ●venlafaxine; anticoagulant effect of warfarin may be enhanced or reduced by trazodone; anticoagulant effect of coumarins possibly enhanced by ●SSRIs; anticoagulant effect of coumarins reduced by ●St John's wort (avoid concomitant use); anticoagulant effect of warfarin enhanced by mirtazapine; anticoagulant effect of coumarins may be enhanced or reduced by ●tricyclics
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by exenatide; coumarins possibly enhance hypoglycaemic effect of ●sulfonylureas, also possible changes to anticoagulant effect
- Antiepileptics: metabolism of coumarins accelerated by ●carbamazepine and ●primidone (reduced anticoagulant effect); plasma concentration of warfarin reduced by eslicarbazepine; metabolism of coumarins accelerated by ●phenytoin (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by valproate
- Antifungals: anticoagulant effect of coumarins enhanced by ●fluconazole, ●itraconazole, ●ketoconazole and ●voriconazole; anticoagulant effect of coumarins enhanced by ●miconazole (miconazole oral gel and possibly vaginal formulations absorbed); anticoagulant effect of coumarins reduced by ●griseofulvin

Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by proguanil; plasma concentration of both drugs increased when warfarin given with quinine

- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by atazanavir, ●nevirapine and ●ritonavir; plasma concentration of warfarin possibly affected by ●efavirenz; anticoagulant effect of coumarins may be enhanced or reduced by fosamprenavir; anticoagulant effect of coumarins possibly enhanced by ●ritonavir; anticoagulant effect of warfarin possibly enhanced by saquinavir

Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by chloral and triclofos

Aprepitant: anticoagulant effect of warfarin possibly reduced by aprepitant

- Azathioprine: anticoagulant effect of coumarins possibly reduced by ●azathioprine
- Barbiturates: metabolism of coumarins accelerated by ●barbiturates (reduced anticoagulant effect)

Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of bosentan

- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of ●clopidogrel; avoidance of warfarin advised by manufacturer of ●clopidogrel
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by ●corticosteroids (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by ●cranberry juice—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by ●etoposide, ●ifosfamide and ●sorafenib; anticoagulant effect of coumarins enhanced by ●fluorouracil; anticoagulant effect of warfarin possibly enhanced by ●gefitinib and gemcitabine; anticoagulant effect of coumarins possibly reduced by ●mercaptopurine and ●mitotane; increased risk of bleeding when coumarins given with ●erlotinib; replacement of warfarin with a heparin advised by manufacturer of imatinib (possibility of enhanced warfarin effect)
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of ●dipyridamole
- Disulfiram: anticoagulant effect of coumarins enhanced by ●disulfiram
- Dopaminergics: anticoagulant effect of warfarin enhanced by ●entacapone
- Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some ●enteral feeds)
- Glucosamine: anticoagulant effect of warfarin enhanced by ●glucosamine (avoid concomitant use)
- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by bicalutamide and ●toremifene; metabolism of coumarins inhibited by ●danazol (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by ●flutamide and ●tamoxifen

Iloprost: anticoagulant effect of coumarins possibly enhanced by iloprost

Lactulose: anticoagulant effect of coumarins possibly enhanced by lactulose

Leflunomide: anticoagulant effect of warfarin possibly enhanced by leflunomide

Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by zafirlukast

Coumarins *(continued)*
- Levamisole: anticoagulant effect of warfarin possibly enhanced by •levamisole
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by •colestyramine; anticoagulant effect of warfarin may be transiently reduced by atorvastatin; anticoagulant effect of coumarins enhanced by •fibrates, •fluvastatin and simvastatin; anticoagulant effect of coumarins possibly enhanced by ezetimibe and •rosuvastatin

Memantine: anticoagulant effect of warfarin possibly enhanced by memantine
- Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by •oestrogens

Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of orlistat

Prasugrel: possible increased risk of bleeding when coumarins given with prasugrel
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by •progestogens

Raloxifene: anticoagulant effect of coumarins antagonised by raloxifene
- Retinoids: anticoagulant effect of coumarins possibly reduced by •acitretin
- Sitaxentan: anticoagulant effect of coumarins enhanced by •sitaxentan
- Sulfinpyrazone: anticoagulant effect of coumarins enhanced by •sulfinpyrazone
- Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by •methylphenidate
- Testolactone: anticoagulant effect of coumarins enhanced by •testolactone
- Testosterone: anticoagulant effect of coumarins enhanced by •testosterone
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by •thyroid hormones

Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by ubidecarenone
- Ulcer-healing Drugs: metabolism of coumarins inhibited by •cimetidine (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by •esomeprazole, •omeprazole and pantoprazole; absorption of coumarins possibly reduced by •sucralfate (reduced anticoagulant effect)

Vaccines: anticoagulant effect of warfarin possibly enhanced by influenza vaccine
- Vitamins: anticoagulant effect of coumarins possibly enhanced by •vitamin E; anticoagulant effect of coumarins antagonised by •vitamin K

Cranberry Juice
- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of •coumarins—avoid concomitant use

Cyclizine *see* Antihistamines

Cyclopenthiazide *see* Diuretics

Cyclopentolate *see* Antimuscarinics

Cyclophosphamide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: side-effects of cyclophosphamide possibly increased by itraconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with •pentostatin—avoid concomitant use

Muscle Relaxants: cyclophosphamide enhances effects of suxamethonium

Cycloserine
- Alcohol: increased risk of convulsions when cycloserine given with •alcohol

Antibacterials: increased risk of CNS toxicity when cycloserine given with isoniazid

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Cyproheptadine *see* Antihistamines

Cytarabine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: cytarabine possibly reduces plasma concentration of flucytosine
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: intracellular concentration of cytarabine increased by fludarabine

Cytotoxics *see* individual drugs

Dabigatran Etexilate
- Analgesics: possible increased risk of bleeding when dabigatran etexilate given with •NSAIDs; increased risk of haemorrhage when anticoagulants given with *intravenous* •diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: plasma concentration of dabigatran etexilate increased by •amiodarone (reduce dose of dabigatran etexilate)
- Calcium-channel Blockers: plasma concentration of dabigatran etexilate possibly increased by •verapamil (reduce dose of dabigatran etexilate)

Dacarbazine
- Aldesleukin: avoidance of dacarbazine advised by manufacturer of •aldesleukin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Dairy Products

Antibacterials: dairy products reduce absorption of ciprofloxacin and norfloxacin; dairy products reduce absorption of tetracyclines (except doxycycline and minocycline)

Eltrombopag: dairy products possibly reduce absorption of eltrombopag (give at least 4 hours apart)

Dalteparin *see* Heparins

Danazol
- Anticoagulants: danazol inhibits metabolism of •coumarins (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of •carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of •ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with •simvastatin

Tacrolimus: danazol possibly increases plasma concentration of tacrolimus

Dantrolene *see* Muscle Relaxants

Dapsone

Antibacterials: plasma concentration of dapsone reduced by rifamycins; plasma concentration of both drugs may increase when dapsone given with trimethoprim
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with •saquinavir—avoid concomitant use

Probenecid: excretion of dapsone reduced by probenecid (increased risk of side-effects)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Daptomycin
- Ciclosporin: increased risk of myopathy when daptomycin given with •ciclosporin (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with •fibrates or •statins (preferably avoid concomitant use)

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Darifenacin *see* Antimuscarinics

Darunavir

Anti-arrhythmics: darunavir possibly increases plasma concentration of lidocaine—avoid concomitant use

- Antibacterials: darunavir increases plasma concentration of •rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by •rifampicin—avoid concomitant use

Anticoagulants: avoidance of darunavir advised by manufacturer of rivaroxaban

- Antidepressants: darunavir possibly reduces plasma concentration of paroxetine and sertraline; plasma concentration of darunavir reduced by •St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of darunavir possibly reduced by carbamazepine and phenytoin

Antifungals: plasma concentration of both drugs increased when darunavir given with ketoconazole

- Antimalarials: caution with darunavir advised by manufacturer of artemether/lumefantrine; darunavir possibly increases plasma concentration of •quinine (increased risk of toxicity)
- Antivirals: plasma concentration of darunavir reduced by efavirenz and saquinavir; plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by •lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of •maraviroc (consider reducing dose of maraviroc)

Barbiturates: plasma concentration of darunavir possibly reduced by phenobarbital

- Cytotoxics: darunavir possibly increases plasma concentration of •everolimus—manufacturer of everolimus advises avoid concomitant use
- Lipid-regulating Drugs: darunavir possibly increases plasma concentration of pravastatin; possible increased risk of myopathy when darunavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use
- Ranolazine: darunavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

Dasatinib

- Antibacterials: metabolism of dasatinib accelerated by •rifampicin (reduced plasma concentration—avoid concomitant use)

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: plasma concentration of dasatinib possibly increased by ketoconazole

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of simvastatin

Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by famotidine

Deferasirox

Antacids: absorption of deferasirox possibly reduced by antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)

Antibacterials: plasma concentration of deferasirox reduced by rifampicin

Antidiabetics: deferasirox increases plasma concentration of repaglinide

Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of midazolam

Deflazacort *see* Corticosteroids

Demeclocycline *see* Tetracyclines

Desferrioxamine

Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levomepromazine; manufacturer of desferrioxamine advises avoid concomitant use with prochlorperazine

Desflurane *see* Anaesthetics, General

Desloratadine *see* Antihistamines

Desmopressin

Analgesics: effects of desmopressin enhanced by indometacin

Loperamide: plasma concentration of *oral* desmopressin increased by loperamide

Desogestrel *see* Progestogens

Dexamethasone *see* Corticosteroids

Dexamfetamine *see* Sympathomimetics

Dexibuprofen *see* NSAIDs

Dexketoprofen *see* NSAIDs

Dextromethorphan *see* Opioid Analgesics

Dextropropoxyphene *see* Opioid Analgesics

Diamorphine *see* Opioid Analgesics

Diazepam *see* Anxiolytics and Hypnotics

Diazoxide

ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when diazoxide given with alcohol

Aldesleukin: enhanced hypotensive effect when diazoxide given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when diazoxide given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when diazoxide given with general anaesthetics

Analgesics: hypotensive effect of diazoxide antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when diazoxide given with MAOIs or tricyclic-related antidepressants

Antidiabetics: diazoxide antagonises hypoglycaemic effect of antidiabetics

Antiepileptics: diazoxide reduces plasma concentration of phenytoin, also effect of diazoxide may be reduced

Antipsychotics: enhanced hypotensive effect when diazoxide given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when diazoxide given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when diazoxide given with clonidine

Corticosteroids: hypotensive effect of diazoxide antagonised by corticosteroids

Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with diuretics

Dopaminergics: enhanced hypotensive effect when diazoxide given with levodopa

Methyldopa: enhanced hypotensive effect when diazoxide given with methyldopa

Moxisylyte: enhanced hypotensive effect when diazoxide given with moxisylyte

Moxonidine: enhanced hypotensive effect when diazoxide given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when diazoxide given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when diazoxide given with nitrates

Prostaglandins: enhanced hypotensive effect when diazoxide given with alprostadil

Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with hydralazine, minoxidil or sodium nitroprusside

Diclofenac *see* NSAIDs

Dicycloverine *see* Antimuscarinics

Didanosine

Note Antacids in tablet formulation may affect absorption of other drugs

- Allopurinol: plasma concentration of didanosine increased by •allopurinol (risk of toxicity)—avoid concomitant use

  Analgesics: plasma concentration of didanosine possibly reduced by methadone
- Antivirals: plasma concentration of didanosine possibly increased by ganciclovir; increased risk of side-effects when didanosine given with •ribavirin—avoid concomitant use; increased risk of side-effects when didanosine given with •stavudine; plasma concentration of didanosine increased by •tenofovir (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by •tipranavir
- Cytotoxics: increased risk of toxicity when didanosine given with •hydroxycarbamide—avoid concomitant use

Dienogest *see* Progestogens

Digoxin *see* Cardiac Glycosides

Dihydrocodeine *see* Opioid Analgesics

Diltiazem *see* Calcium-channel Blockers

Dimercaprol

- Iron: avoid concomitant use of dimercaprol with •iron

Dimethyl sulfoxide

- Analgesics: avoid concomitant use of dimethyl sulfoxide with •sulindac

Dinoprostone *see* Prostaglandins

Diphenoxylate *see* Opioid Analgesics

Dipipanone *see* Opioid Analgesics

Dipyridamole

Antacids: absorption of dipyridamole possibly reduced by antacids

- Anti-arrhythmics: dipyridamole enhances and extends the effects of •adenosine (important risk of toxicity)
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of •coumarins and •phenindione; dipyridamole enhances anticoagulant effect of heparins

  Clopidogrel: increased risk of bleeding when dipyridamole given with clopidogrel

  Cytotoxics: dipyridamole possibly reduces effects of fludarabine

Disodium Etidronate *see* Bisphosphonates

Disodium Pamidronate *see* Bisphosphonates

Disopyramide

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics; increased risk of ventricular arrhythmias when disopyramide given with •amiodarone or •dronedarone—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by •clarithromycin (increased risk of toxicity); plasma concentration of disopyramide increased by •erythromycin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with •moxifloxacin—avoid concomitant use; metabolism of disopyramide accelerated by •rifamycins (reduced plasma concentration)
- Antidepressants: increased risk of ventricular arrhythmias when disopyramide given with •tricyclics

  Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of gliclazide, insulin and metformin

  Antiepileptics: plasma concentration of disopyramide reduced by phenytoin; metabolism of disopyramide accelerated by primidone (reduced plasma concentration)
- Antifungals: increased risk of ventricular arrhythmias when disopyramide given with •ketoconazole—avoid concomitant use; avoidance of disopyramide advised by manufacturer of •itraconazole

Disopyramide *(continued)*

- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of disopyramide advised by manufacturer of •artemether/lumefantrine (risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with antimuscarinics; increased risk of ventricular arrhythmias when disopyramide given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with •amisulpride, •droperidol, •pimozide or •zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with •haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with •phenothiazines or •sulpiride
- Antivirals: plasma concentration of disopyramide possibly increased by •ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with •saquinavir—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with •atomoxetine

  Barbiturates: metabolism of disopyramide accelerated by barbiturates (reduced plasma concentration)
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with •beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with •sotalol—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with •verapamil
- Cytotoxics: increased risk of ventricular arrhythmias when disopyramide given with •arsenic trioxide
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with •acetazolamide, •loop diuretics or •thiazides and related diuretics
- Ivabradine: increased risk of ventricular arrhythmias when disopyramide given with •ivabradine

  Nitrates: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)
- Ranolazine: avoidance of disopyramide advised by manufacturer of •ranolazine

Distigmine *see* Parasympathomimetics

Disulfiram

Alcohol: disulfiram reaction when disulfiram given with alcohol (see p. 310)

Antibacterials: psychotic reaction reported when disulfiram given with metronidazole; CNS effects of disulfiram possibly increased by isoniazid

- Anticoagulants: disulfiram enhances anticoagulant effect of •coumarins

  Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of •phenytoin (increased risk of toxicity)

  Anxiolytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects)
- Paraldehyde: risk of toxicity when disulfiram given with •paraldehyde

  Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity)

Diuretics

Note Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

Note Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind

- ACE Inhibitors: enhanced hypotensive effect when diuretics given with •ACE inhibitors; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •ACE inhibitors (monitor potassium concentration with low-dose spironolactone in heart failure)

Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when diuretics given with alcohol

Aldesleukin: enhanced hypotensive effect when diuretics given with aldesleukin

Aliskiren: plasma concentration of furosemide reduced by aliskiren; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with aliskiren

Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with allopurinol especially in renal impairment

- Alpha-blockers: enhanced hypotensive effect when diuretics given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when diuretics given with general anaesthetics

- Analgesics: diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect; Diuretic effect of potassium canrenoate possibly antagonised by NSAIDs; possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDs; effects of diuretics antagonised by indometacin and ketorolac; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with indometacin; occasional reports of reduced renal function when triamterene given with •indometacin—avoid concomitant use; diuretic effect of spironolactone antagonised by aspirin; increased risk of toxicity when carbonic anhydrase inhibitors given with high-dose aspirin
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with •angiotensin-II receptor antagonists; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •angiotensin-II receptor antagonists
- Anti-arrhythmics: plasma concentration of eplerenone increased by amiodarone (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •disopyramide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •flecainide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of •lidocaine
- Antibacterials: plasma concentration of eplerenone increased by •clarithromycin and •telithromycin—avoid concomitant use; plasma concentration of eplerenone increased by erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by •rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymecycline; increased risk of otoxicity when loop diuretics given with •aminoglycosides, •polymyxins or •vancomycin; acetazolamide antagonises effects of •methenamine; increased risk of

Diuretics

- Antibacterials *(continued)* hyperkalaemia when eplerenone given with trimethoprim
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with reboxetine; enhanced hypotensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by •St John's wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with tricyclics

Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of antidiabetics

- Antiepileptics: plasma concentration of eplerenone reduced by •carbamazepine and •phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine; acetazolamide increases plasma concentration of •carbamazepine; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of •phenytoin; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenytoin or primidone; acetazolamide possibly reduces plasma concentration of primidone; hydrochlorothiazide possibly increases plasma concentration of topiramate
- Antifungals: plasma concentration of eplerenone increased by •itraconazole and •ketoconazole—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with amphotericin; hydrochlorothiazide increases plasma concentration of fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone)
- Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with •amisulpride; enhanced hypotensive effect when diuretics given with phenothiazines; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with •pimozide (avoid concomitant use)
- Antivirals: plasma concentration of eplerenone increased by •nelfinavir and •ritonavir—avoid concomitant use; plasma concentration of eplerenone increased by saquinavir (reduce dose of eplerenone)

Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with anxiolytics and hypnotics; administration of *parenteral* furosemide with chloral or triclofos may displace thyroid hormone from binding sites

- Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with •atomoxetine
- Barbiturates: increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital; plasma concentration of eplerenone reduced by •phenobarbital—avoid concomitant use
- Beta-blockers: enhanced hypotensive effect when diuretics given with beta-blockers; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with •sotalol

Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with calcium salts

Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with calcium-channel blockers; plasma concentration of eplerenone increased by diltiazem and verapamil (reduce dose of eplerenone)

- Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •cardiac glycosides; spironolactone increases plasma concentration of •digoxin; potassium canrenoate possibly increases plasma concentration of digoxin

Diuretics *(continued)*

- Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with ciclosporin; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •ciclosporin; acetazolamide possibly increases plasma concentration of •ciclosporin

  Clonidine: enhanced hypotensive effect when diuretics given with clonidine

  Corticosteroids: diuretic effect of diuretics antagonised by corticosteroids; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with corticosteroids

- Cytotoxics: alkaline urine due to acetazolamide increases excretion of methotrexate; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with •arsenic trioxide; avoidance of spironolactone advised by manufacturer of mitotane (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with platinum compounds

  Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with diazoxide

  Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with acetazolamide; profound diuresis possible when metolazone given with furosemide; increased risk of hypokalaemia when thiazides and related diuretics given with loop diuretics

  Dopaminergics: enhanced hypotensive effect when diuretics given with levodopa

  Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with toremifene; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with trilostane

  Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by colestipol and colestyramine (give at least 2 hours apart)

- Lithium: loop diuretics and thiazides and related diuretics reduce excretion of •lithium (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of •lithium (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of •lithium

  Methyldopa: enhanced hypotensive effect when diuretics given with methyldopa

  Moxisylyte: enhanced hypotensive effect when diuretics given with moxisylyte

  Moxonidine: enhanced hypotensive effect when diuretics given with moxonidine

  Muscle Relaxants: enhanced hypotensive effect when diuretics given with baclofen or tizanidine

  Nitrates: enhanced hypotensive effect when diuretics given with nitrates

  Oestrogens: diuretic effect of diuretics antagonised by oestrogens

- Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •potassium salts

  Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with drospirenone (monitor serum potassium during first cycle)

  Prostaglandins: enhanced hypotensive effect when diuretics given with alprostadil

  Sympathomimetics, Beta$_2$: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of beta$_2$ sympathomimetics—see Hypokalaemia, p. 176

Diuretics *(continued)*

- Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •tacrolimus

  Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with theophylline

  Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with hydralazine, minoxidil or sodium nitroprusside

  Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with vitamin D

Diuretics, Loop *see* Diuretics

Diuretics, Potassium-sparing and Aldosterone Antagonists *see* Diuretics

Diuretics, Thiazide and related *see* Diuretics

Dobutamine *see* Sympathomimetics

Docetaxel

- Antibacterials: *in vitro* studies suggest a possible interaction between docetaxel and erythromycin (consult docetaxel product literature)

  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

  Antifungals: *in vitro* studies suggest a possible interaction between docetaxel and ketoconazole (consult docetaxel product literature)

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of docetaxel possibly increased by •ritonavir (increased risk of toxicity)

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

  Ciclosporin: *in vitro* studies suggest a possible interaction between docetaxel and ciclosporin (consult docetaxel product literature)

  Cytotoxics: possible increased risk of neutropenia when docetaxel given with lapatinib; plasma concentration of docetaxel increased by sorafenib

Domperidone

- Analgesics: effects of domperidone on gastro-intestinal activity antagonised by opioid analgesics
- Antifungals: risk of arrhythmias with domperidone possibly increased by •ketoconazole

  Antimuscarinics: effects of domperidone on gastro-intestinal activity antagonised by antimuscarinics

  Dopaminergics: domperidone possibly antagonises hypoprolactinaemic effects of bromocriptine and cabergoline

Donepezil *see* Parasympathomimetics

Dopamine *see* Sympathomimetics

Dopaminergics *see* Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine *see* Sympathomimetics

Doripenem

- Antiepileptics: carbapenems reduce plasma concentration of •valproate—avoid concomitant use

  Probenecid: excretion of doripenem reduced by probenecid (manufacturers of doripenem advise avoid concomitant use)

  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Dorzolamide *see* Diuretics

Dosulepin *see* Antidepressants, Tricyclic

Doxapram

- Anaesthetics, General: increased risk of arrhythmias when doxapram given with •volatile liquid general anaesthetics (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

  Antidepressants: effects of doxapram enhanced by MAOIs

  Sympathomimetics: increased risk of hypertension when doxapram given with sympathomimetics

  Theophylline: increased CNS stimulation when doxapram given with theophylline

Doxazosin *see* Alpha-blockers

Doxepin *see* Antidepressants, Tricyclic

Doxorubicin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Antivirals: doxorubicin possibly inhibits effects of stavudine

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with •ciclosporin

Cytotoxics: plasma concentration of doxorubicin possibly increased by sorafenib

Doxycycline *see* Tetracyclines

Dronedarone

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics; increased risk of ventricular arrhythmias when dronedarone given with •amiodarone or •disopyramide—avoid concomitant use
- Antibacterials: manufacturer of dronedarone advises avoid concomitant use with •clarithromycin or •telithromycin (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly increased by •erythromycin (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by •rifampicin—avoid concomitant use
- Antidepressants: plasma concentration of dronedarone possibly reduced by •St John's wort—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with •tricyclics (risk of ventricular arrhythmias)
- Antiepileptics: plasma concentration of dronedarone possibly reduced by •carbamazepine and •phenytoin—avoid concomitant use
- Antifungals: plasma concentration of dronedarone increased by •ketoconazole—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with •itraconazole, •posaconazole and •voriconazole
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with •phenothiazines (risk of ventricular arrhythmias)
- Antivirals: manufacturer of dronedarone advises avoid concomitant use with •ritonavir; increased risk of ventricular arrhythmias when dronedarone given with •saquinavir—avoid concomitant use
- Barbiturates: plasma concentration of dronedarone possibly reduced by •phenobarbital—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with •beta-blockers; dronedarone possibly increases plasma concentration of metoprolol and propranolol; increased risk of ventricular arrhythmias when dronedarone given with •sotalol—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of dronedarone increased by •nifedipine; increased risk of bradycardia and myocardial depression when dronedarone given with •diltiazem and •verapamil
- Cardiac Glycosides: dronedarone increases plasma concentration of •digoxin (halve dose of digoxin)
- Grapefruit Juice: plasma concentration of dronedarone increased by •grapefruit juice—avoid concomitant use
- Lipid-regulating Drugs: increased risk of myopathy when dronedarone given with •simvastatin

Sirolimus: manufacturer of dronedarone advises caution with sirolimus

Dronedarone *(continued)*

Tacrolimus: manufacturer of dronedarone advises caution with tacrolimus

Droperidol *see* Antipsychotics

Drospirenone *see* Progestogens

Drotrecogin Alfa

- Anticoagulants: manufacturer of drotrecogin alfa advises avoid concomitant use with high doses of •heparins—consult product literature

Duloxetine

Analgesics: possible increased serotonergic effects when duloxetine given with pethidine or tramadol

- Antibacterials: metabolism of duloxetine inhibited by •ciprofloxacin—avoid concomitant use
- Antidepressants: metabolism of duloxetine inhibited by •fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John's wort, amitriptyline, clomipramine, •moclobemide, tryptophan or venlafaxine; duloxetine should not be started until 2 weeks after stopping •MAOIs, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start •moclobemide for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

$5HT_1$ Agonists: possible increased serotonergic effects when duloxetine given with $5HT_1$ agonists

Dutasteride

Calcium-channel Blockers: plasma concentration of dutasteride increased by diltiazem and verapamil

Dydrogesterone *see* Progestogens

Edrophonium *see* Parasympathomimetics

Efavirenz

Analgesics: efavirenz reduces plasma concentration of methadone

Antibacterials: increased risk of rash when efavirenz given with clarithromycin; efavirenz reduces plasma concentration of rifabutin—increase dose of rifabutin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz

- Anticoagulants: efavirenz possibly affects plasma concentration of •warfarin
- Antidepressants: plasma concentration of efavirenz reduced by •St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine

- Antifungals: efavirenz reduces plasma concentration of itraconazole and •posaconazole; efavirenz reduces plasma concentration of •voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antipsychotics: efavirenz possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole; efavirenz possibly increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of •atazanavir (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of darunavir, fosamprenavir and indinavir; efavirenz possibly reduces plasma concentration of •etravirine—avoid concomitant use; efavirenz reduces plasma concentration of •lopinavir—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of •maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine; toxicity of efavirenz increased by ritonavir, monitor liver function tests; efavirenz significantly reduces plasma concentration of saquinavir

Efavirenz *(continued)*
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with •midazolam—avoid concomitant use
- Calcium-channel Blockers: efavirenz reduces plasma concentration of diltiazem
- Ciclosporin: efavirenz possibly reduces plasma concentration of •ciclosporin
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with •ergot alkaloids—avoid concomitant use
- Grapefruit Juice: plasma concentration of efavirenz possibly increased by grapefruit juice
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of atorvastatin, pravastatin and simvastatin
- Oestrogens: efavirenz possibly reduces contraceptive effect of oestrogens
- Progestogens: efavirenz possibly reduces contraceptive effect of •progestogens
- Tacrolimus: efavirenz possibly affects plasma concentration of •tacrolimus

Eletriptan *see* $5HT_1$ Agonists

Eltrombopag
- Antacids: absorption of eltrombopag reduced by antacids (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by lopinavir
- Calcium Salts: absorption of eltrombopag possibly reduced by calcium salts (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by dairy products (give at least 4 hours apart)
- Iron: absorption of eltrombopag possibly reduced by *oral* iron (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of •rosuvastatin (consider reducing dose of rosuvastatin)
- Selenium: absorption of eltrombopag possibly reduced by selenium (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by zinc (give at least 4 hours apart)

Emtricitabine
- Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine

Enalapril *see* ACE Inhibitors

Enoxaparin *see* Heparins

Enoximone *see* Phosphodiesterase Inhibitors

Entacapone
- Anticoagulants: entacapone enhances anticoagulant effect of •warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, paroxetine, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective •MAOIs
- Dopaminergics: entacapone possibly enhances effects of apomorphine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10 mg selegiline if used concomitantly
- Iron: absorption of entacapone reduced by *oral* iron
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyldopa: entacapone possibly enhances effects of methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Sympathomimetics: entacapone possibly enhances effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine)

Enteral Foods
- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of •coumarins and •phenindione
- Antiepileptics: enteral feeds possibly reduce absorption of phenytoin

Ephedrine *see* Sympathomimetics

Epinephrine (adrenaline) *see* Sympathomimetics

Epirubicin
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Ciclosporin: plasma concentration of epirubicin increased by •ciclosporin
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by •cimetidine

Eplerenone *see* Diuretics

Eprosartan *see* Angiotensin-II Receptor Antagonists

Eptifibatide
- Iloprost: increased risk of bleeding when eptifibatide given with iloprost

Ergometrine *see* Ergot Alkaloids

Ergot Alkaloids
- Anaesthetics, General: effects of ergometrine on the parturient uterus reduced by halothane
- Antibacterials: increased risk of ergotism when ergotamine and methysergide given with •macrolides or •telithromycin—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with tetracyclines
- Antidepressants: possible risk of hypertension when ergotamine and methysergide given with reboxetine
- Antifungals: increased risk of ergotism when ergotamine and methysergide given with •imidazoles or •triazoles—avoid concomitant use
- Antivirals: plasma concentration of ergot alkaloids possibly increased by •atazanavir—avoid concomitant use; increased risk of ergotism when ergot alkaloids given with •efavirenz—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with •fosamprenavir, •indinavir, •nelfinavir, •ritonavir or •saquinavir—avoid concomitant use
- Beta-blockers: increased peripheral vasoconstriction when ergotamine and methysergide given with beta-blockers
- $5HT_1$ Agonists: increased risk of vasospasm when ergotamine and methysergide given with •almotriptan, •rizatriptan, •sumatriptan or •zolmitriptan (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide); increased risk of vasospasm when ergotamine and methysergide given with •eletriptan, •frovatriptan or •naratriptan (avoid ergotamine and methysergide for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine and methysergide)
- Sympathomimetics: increased risk of ergotism when ergotamine and methysergide given with sympathomimetics
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine and methysergide given with •cimetidine—avoid concomitant use

Ergotamine and Methysergide *see* Ergot Alkaloids

Erlotinib
- Analgesics: increased risk of bleeding when erlotinib given with •NSAIDs
- Antacids: plasma concentration of erlotinib possibly reduced by •antacids—give antacids at least 4 hours before or 2 hours after erlotinib
- Antibacterials: plasma concentration of erlotinib increased by ciprofloxacin; metabolism of erlotinib accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with •coumarins
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of erlotinib inhibited by ketoconazole (increased plasma concentration)

Erlotinib *(continued)*
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: plasma concentration of erlotinib possibly increased by capecitabine
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with •cimetidine, •esomeprazole, •famotidine, •lansoprazole, •nizatidine, •pantoprazole and •rabeprazole; plasma concentration of erlotinib reduced by •ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by •omeprazole—manufacturer of erlotinib advises avoid concomitant use

Ertapenem
- Antiepileptics: carbapenems reduce plasma concentration of •valproate—avoid concomitant use

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Erythromycin *see* Macrolides

Escitalopram *see* Antidepressants, SSRI

Eslicarbazepine

Anticoagulants: eslicarbazepine reduces plasma concentration of warfarin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

Antiepileptics: plasma concentration of both drugs reduced when eslicarbazepine given with carbamazepine; manufacturer of eslicarbazepine advises avoid concomitant use with oxcarbazepine; plasma concentration of eslicarbazepine reduced by phenytoin, also plasma concentration of phenytoin increased
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Oestrogens: eslicarbazepine accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat
- Progestogens: eslicarbazepine accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Esmolol *see* Beta-blockers

Esomeprazole *see* Proton Pump Inhibitors

Estradiol *see* Oestrogens

Estramustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by •sodium clodronate

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Estriol *see* Oestrogens

Estrone *see* Oestrogens

Etanercept
- Abatacept: avoid concomitant use of etanercept with •abatacept
- Anakinra: avoid concomitant use of etanercept with •anakinra
- Vaccines: avoid concomitant use of etanercept with live •vaccines (see p. 746)

Ethinylestradiol *see* Oestrogens

Ethosuximide
- Antibacterials: metabolism of ethosuximide inhibited by •isoniazid (increased plasma concentration and risk of toxicity)

Ethosuximide *(continued)*
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by carbamazepine and primidone; plasma concentration of ethosuximide possibly reduced by •phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of ethosuximide antagonised by •antipsychotics (convulsive threshold lowered)

Barbiturates: plasma concentration of ethosuximide possibly reduced by phenobarbital
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Etodolac *see* NSAIDs

Etomidate *see* Anaesthetics, General

Etonogestrel *see* Progestogens

Etoposide
- Anticoagulants: etoposide possibly enhances anticoagulant effect of •coumarins

Antiepileptics: plasma concentration of etoposide possibly reduced by phenytoin; cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Barbiturates: plasma concentration of etoposide possibly reduced by phenobarbital

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Ciclosporin: plasma concentration of etoposide possibly increased by ciclosporin (increased risk of toxicity)

Etoricoxib *see* NSAIDs

Etravirine
- Antibacterials: plasma concentration of etravirine increased by •clarithromycin, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs reduced when etravirine given with •rifabutin; manufacturer of etravirine advises avoid concomitant use with rifampicin

Antidepressants: manufacturer of etravirine advises avoid concomitant use with St John's wort

Antiepileptics: manufacturer of etravirine advises avoid concomitant use with carbamazepine and phenytoin
- Antivirals: plasma concentration of etravirine possibly reduced by •efavirenz and •nevirapine—avoid concomitant use; etravirine increases plasma concentration of •fosamprenavir (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of •indinavir—avoid concomitant use; etravirine possibly reduces plasma concentration of maraviroc; etravirine possibly increases plasma concentration of nelfinavir—avoid concomitant use; plasma concentration of etravirine reduced by •tipranavir, also plasma concentration of tipranavir increased (avoid concomitant use)

Barbiturates: manufacturer of etravirine advises avoid concomitant use with phenobarbital

Cardiac Glycosides: etravirine increases plasma concentration of digoxin
- Clopidogrel: etravirine possibly reduces antiplatelet effect of •clopidogrel

Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of atorvastatin

Sildenafil: etravirine reduces plasma concentration of sildenafil

Etynodiol *see* Progestogens

Everolimus

- Antibacterials: plasma concentration of everolimus possibly increased by •clarithromycin and •telithromycin—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by •erythromycin; plasma concentration of everolimus reduced by •rifampicin

Antidepressants: plasma concentration of everolimus possibly reduced by St John's wort—manufacturer of everolimus advises avoid concomitant use

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antifungals: plasma concentration of everolimus increased by •ketoconazole—avoid concomitant use; plasma concentration of everolimus possibly increased by •itraconazole, •posaconazole and •voriconazole—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by •atazanavir, •darunavir, •indinavir, •nelfinavir, •ritonavir and •saquinavir—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with •verapamil

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Ciclosporin: plasma concentration of everolimus increased by •ciclosporin

Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with grapefruit juice

Exemestane

Antibacterials: plasma concentration of exemestane possibly reduced by rifampicin

Ezetimibe

Anticoagulants: ezetimibe possibly enhances anticoagulant effect of coumarins

- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with •ciclosporin

Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when ezetimibe given with fibrates—discontinue if suspected

Famciclovir

Probenecid: excretion of famciclovir possibly reduced by probenecid (increased plasma concentration)

Famotidine *see* Histamine H_2-antagonists

Febuxostat

- Azathioprine: manufacturer of febuxostat advises avoid concomitant use with •azathioprine
- Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with •mercaptopurine
- Theophylline: manufacturer of febuxostat advises caution with •theophylline

Felodipine *see* Calcium-channel Blockers

Fenbufen *see* NSAIDs

Fenofibrate *see* Fibrates

Fenoprofen *see* NSAIDs

Fenoterol *see* Sympathomimetics, $Beta_2$

Fentanyl *see* Opioid Analgesics

Ferrous Salts *see* Iron

Fesoterodine *see* Antimuscarinics

Fexofenadine *see* Antihistamines

Fibrates

- Antibacterials: increased risk of myopathy when fibrates given with •daptomycin (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of •coumarins and •phenindione
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with insulin or sulfonylureas; gemfibrozil possibly enhances hypoglycaemic effect of nateglinide; increased risk of severe hypoglycaemia when gemfibrozil given with •repaglinide—avoid concomitant use

Fibrates *(continued)*

Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin

- Colchicine: possible increased risk of myopathy when fibrates given with •colchicine
- Cytotoxics: gemfibrozil increases plasma concentration of •bexarotene—avoid concomitant use
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disaese when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when fibrates given with •statins; increased risk of myopathy when gemfibrozil given with •statins (preferably avoid concomitant use)

Filgrastim

Note Pegfilgrastim interactions as for filgrastim

Cytotoxics: neutropenia possibly exacerbated when filgrastim given with fluorouracil

Flavoxate *see* Antimuscarinics

Flecainide

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics; plasma concentration of flecainide increased by •amiodarone (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by fluoxetine; increased risk of ventricular arrhythmias when flecainide given with •tricyclics
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of •artemether/lumefantrine (risk of ventricular arrhythmias); plasma concentration of flecainide increased by •quinine
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with •tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with •clozapine
- Antivirals: plasma concentration of flecainide possibly increased by •fosamprenavir, •indinavir, •lopinavir and •ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with •saquinavir—avoid concomitant use
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with •beta-blockers; increased myocardial depression when anti-arrhythmics given with •beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with •verapamil
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with •acetazolamide, •loop diuretics or •thiazides and related diuretics

Ulcer-healing Drugs: metabolism of flecainide inhibited by cimetidine (increased plasma concentration)

Flucloxacillin *see* Penicillins

Fluconazole *see* Antifungals, Triazole

Flucytosine

Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by amphotericin (toxicity possibly increased)

Cytotoxics: plasma concentration of flucytosine possibly reduced by cytarabine

Fludarabine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Fludarabine *(continued)*
- Cytotoxics: fludarabine increases intracellular concentration of cytarabine; increased pulmonary toxicity when fludarabine given with •pentostatin (unacceptably high incidence of fatalities)

Dipyridamole: effects of fludarabine possibly reduced by dipyridamole

Fludrocortisone *see* Corticosteroids

Flunisolide *see* Corticosteroids

Fluorides

Calcium Salts: absorption of fluorides reduced by calcium salts

Fluorouracil

Note Capecitabine is a prodrug of fluorouracil

Note Tegafur is a prodrug of fluorouracil
- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with •allopurinol

Antibacterials: metabolism of fluorouracil inhibited by metronidazole (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of •coumarins

Antiepileptics: fluorouracil possibly inhibits metabolism of phenytoin (increased risk of toxicity); cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: capecitabine possibly increases plasma concentration of erlotinib

Filgrastim: neutropenia possibly exacerbated when fluorouracil given with filgrastim
- Temoporfin: increased skin photosensitivity when *topical* fluorouracil used with •temoporfin

Ulcer-healing Drugs: metabolism of fluorouracil inhibited by cimetidine (increased plasma concentration)

Fluoxetine *see* Antidepressants, SSRI

Flupentixol *see* Antipsychotics

Fluphenazine *see* Antipsychotics

Flurazepam *see* Anxiolytics and Hypnotics

Flurbiprofen *see* NSAIDs

Flutamide
- Anticoagulants: flutamide enhances anticoagulant effect of •coumarins

Fluticasone *see* Corticosteroids

Fluvastatin *see* Statins

Fluvoxamine *see* Antidepressants, SSRI

Folates

Aminosalicylates: absorption of folic acid possibly reduced by sulfasalazine

Antiepileptics: folates possibly reduce plasma concentration of phenytoin and primidone

Barbiturates: folates possibly reduce plasma concentration of phenobarbital
- Cytotoxics: avoidance of folates advised by manufacturer of •raltitrexed

Folic Acid *see* Folates

Folinic Acid *see* Folates

Formoterol *see* Sympathomimetics, $Beta_2$

Fosamprenavir

Note Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of methadone
- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of •amiodarone, •flecainide and •propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of •lidocaine—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of •rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by •rifampicin—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Fosamprenavir *(continued)*

Anticoagulants: fosamprenavir may enhance or reduce anticoagulant effect of coumarins; avoidance of fosamprenavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of fosamprenavir reduced by •St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of fosamprenavir possibly reduced by carbamazepine

Antifungals: fosamprenavir increases plasma concentration of ketoconazole (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with itraconazole
- Antimalarials: caution with fosamprenavir advised by manufacturer of artemether/lumefantrine; fosamprenavir possibly increases plasma concentration of •quinine (increased risk of toxicity)

Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of darifenacin and tolterodine
- Antipsychotics: fosamprenavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); fosamprenavir increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of fosamprenavir reduced by efavirenz and •tipranavir; plasma concentration of fosamprenavir increased by •etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by nevirapine
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of •midazolam (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)

Barbiturates: plasma concentration of fosamprenavir possibly reduced by phenobarbital
- Ciclosporin: fosamprenavir increases plasma concentration of •ciclosporin
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with •ergotamine and methysergide—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with •simvastatin—avoid concomitant use
- Ranolazine: fosamprenavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil
- Tacrolimus: fosamprenavir increases plasma concentration of •tacrolimus

Tadalafil: fosamprenavir possibly increases plasma concentration of tadalafil

Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant *see* Aprepitant

Foscarnet

Antivirals: avoidance of foscarnet advised by manufacturer of lamivudine
- Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with *parenteral* •pentamidine isetionate

Fosinopril *see* ACE Inhibitors

Fosphenytoin *see* Phenytoin

Framycetin *see* Aminoglycosides

Frovatriptan *see* $5HT_1$ Agonists

Furosemide *see* Diuretics

Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with •ritonavir—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fusidic acid given with atorvastatin; increased risk of myopathy when fusidic acid given with •simvastatin

Sugammadex: fusidic acid possibly reduces response to sugammadex

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Gabapentin

Analgesics: bioavailability of gabapentin increased by morphine

Antacids: absorption of gabapentin reduced by antacids
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Galantamine *see* Parasympathomimetics

Ganciclovir

Note Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature

Note Valganciclovir interactions as for ganciclovir
- Antibacterials: increased risk of convulsions when ganciclovir given with •imipenem with cilastatin
- Antivirals: ganciclovir possibly increases plasma concentration of didanosine; avoidance of *intravenous* ganciclovir advised by manufacturer of lamivudine; profound myelosuppression when ganciclovir given with •zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)

Mycophenolate: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Probenecid: excretion of ganciclovir reduced by probenecid (increased plasma concentration and risk of toxicity)

Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gefitinib
- Antibacterials: plasma concentration of gefitinib reduced by •rifampicin—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of •warfarin

Antidepressants: manufacturer of gefitinib advises avoid concomitant use with St John's wort

Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with carbamazepine and phenytoin; cytotoxics possibly reduce absorption of phenytoin

Antifungals: plasma concentration of gefitinib increased by itraconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Barbiturates: manufacturer of gefitinib advises avoid concomitant use with barbiturates

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by •ranitidine

Gemcitabine

Anticoagulants: gemcitabine possibly enhances anticoagulant effect of warfarin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Gemcitabine *(continued)*
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Gemeprost *see* Prostaglandins

Gemfibrozil *see* Fibrates

Gentamicin *see* Aminoglycosides

Gestodene *see* Progestogens

Glibenclamide *see* Antidiabetics

Gliclazide *see* Antidiabetics

Glimepiride *see* Antidiabetics

Glipizide *see* Antidiabetics

Glucosamine
- Anticoagulants: glucosamine enhances anticoagulant effect of •warfarin (avoid concomitant use)

Glyceryl Trinitrate *see* Nitrates

Glycopyrronium *see* Antimuscarinics

Gold *see* Sodium Aurothiomalate

Golimumab
- Abatacept: avoid concomitant use of golimumab with •abatacept
- Anakinra: avoid concomitant use of golimumab with •anakinra
- Vaccines: avoid concomitant use of golimumab with live •vaccines (see p. 746)

Grapefruit Juice
- Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone; grapefruit juice increases plasma concentration of •dronedarone—avoid concomitant use
- Antihistamines: grapefruit juice increases plasma concentration of •rupatadine—avoid concomitant use

Antimalarials: grapefruit juice possibly increases plasma concentration of artemether/lumefantrine

Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz

Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of buspirone

Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of amlodipine; grapefruit juice increases plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of •ciclosporin (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of •colchicine toxicity
- Cytotoxics: avoidance of grapefruit juice advised by manufacturer of everolimus, •lapatinib, •nilotinib and •pazopanib; grapefruit juice possibly increases plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use

Ivabradine: grapefruit juice increases plasma concentration of ivabradine
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice increases plasma concentration of •simvastatin—avoid concomitant use
- Ranolazine: grapefruit juice possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil
- Sirolimus: grapefruit juice increases plasma concentration of •sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of •tacrolimus

Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of •tolvaptan—avoid concomitant use
- Vardenafil: grapefruit juice possibly increases plasma concentration of •vardenafil—avoid concomitant use

Griseofulvin

Alcohol: griseofulvin possibly enhances effects of alcohol

- Anticoagulants: griseofulvin reduces anticoagulant effect of •coumarins

Antiepileptics: absorption of griseofulvin reduced by primidone (reduced effect)

Barbiturates: absorption of griseofulvin reduced by phenobarbital (reduced effect)

Ciclosporin: griseofulvin possibly reduces plasma concentration of ciclosporin

Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with oestrogens

Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with progestogens

Guanethidine *see* Adrenergic Neurone Blockers

Haloperidol *see* Antipsychotics

Halothane *see* Anaesthetics, General

Heparin *see* Heparins

Heparins

ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors

Aliskiren: increased risk of hyperkalaemia when heparins given with aliskiren

- Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants given with *intravenous* •diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by •aspirin

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with angiotensin-II receptor antagonists

Clopidogrel: increased risk of bleeding when heparins given with clopidogrel

Dipyridamole: anticoagulant effect of heparins enhanced by dipyridamole

- Drotrecogin Alfa: avoidance of concomitant use of high doses of heparins with drotrecogin alfa advised by manufacturer of •drotrecogin alfa—consult product literature

Iloprost: anticoagulant effect of heparins possibly enhanced by iloprost

- Nitrates: anticoagulant effect of heparins reduced by *infusion* of •glyceryl trinitrate

Histamine

Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by tricyclics—manufacturer of histamine advises avoid concomitant use

Antihistamines: effects of histamine theoretically antagonised by antihistamines—manufacturer of histamine advises avoid concomitant use

Antimalarials: manufacturer of histamine advises avoid concomitant use with antimalarials

Antipsychotics: effects of histamine theoretically antagonised by antipsychotics—manufacturer of histamine advises avoid concomitant use

Atovaquone: manufacturer of histamine advises avoid concomitant use with atovaquone

Clonidine: manufacturer of histamine advises avoid concomitant use with clonidine

Corticosteroids: manufacturer of histamine advises avoid concomitant use with corticosteroids

Ulcer-healing Drugs: effects of histamine theoretically antagonised by histamine H_2-antagonists—manufacturer of histamine advises avoid concomitant use

Histamine H_2-antagonists

- Alpha-blockers: cimetidine and ranitidine antagonise effects of •tolazoline

Analgesics: cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)

Histamine H_2-antagonists *(continued)*

- Anti-arrhythmics: cimetidine increases plasma concentration of amiodarone and •propafenone; cimetidine inhibits metabolism of flecainide (increased plasma concentration); cimetidine increases plasma concentration of •lidocaine (increased risk of toxicity)

Antibacterials: histamine H_2-antagonists reduce absorption of cefpodoxime; cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)

- Anticoagulants: cimetidine inhibits metabolism of •coumarins (enhanced anticoagulant effect)

Antidepressants: cimetidine increases plasma concentration of citalopram, escitalopram, mirtazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halve dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics

Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine enhances hypoglycaemic effect of sulfonylureas

- Antiepileptics: cimetidine inhibits metabolism of •carbamazepine, •phenytoin and •valproate (increased plasma concentration)
- Antifungals: histamine H_2-antagonists reduce absorption of itraconazole and ketoconazole; avoidance of histamine H_2-antagonists advised by manufacturer of posaconazole (plasma concentration of posaconazole possibly reduced); cimetidine reduces plasma concentration of •posaconazole; cimetidine increases plasma concentration of terbinafine

Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine

- Antimalarials: avoidance of cimetidine advised by manufacturer of •artemether/lumefantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)

Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine

- Antivirals: histamine H_2-antagonists reduce plasma concentration of •atazanavir; histamine H_2-antagonists possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; cimetidine possibly increases plasma concentration of saquinavir

Anxiolytics and Hypnotics: cimetidine inhibits metabolism of benzodiazepines, clomethiazole and zaleplon (increased plasma concentration); cimetidine increases plasma concentration of melatonin

Beta-blockers: cimetidine increases plasma concentration of labetalol, metoprolol and propranolol

Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of isradipine (halve dose of isradipine)

- Ciclosporin: cimetidine possibly increases plasma concentration of •ciclosporin
- Clopidogrel: cimetidine possibly reduces antiplatelet effect of •clopidogrel
- Cytotoxics: cimetidine possibly enhances myelosuppressive effects of carmustine and lomustine; cimetidine increases plasma concentration of •epirubicin; cimetidine inhibits metabolism of fluorouracil (increased plasma concentration); famotidine possibly reduces plasma concentration of dasatinib; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of •erlotinib; ranitidine

Histamine H_2-antagonists

- Cytotoxics *(continued)*
  reduces plasma concentration of ●erlotinib—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of ●gefitinib; histamine H_2-antagonists possibly reduce absorption of lapatinib
  Dopaminergics: cimetidine reduces excretion of pramipexole (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with ●ergotamine and methysergide—avoid concomitant use
  Histamine: histamine H_2-antagonists theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use
  Hormone Antagonists: absorption of cimetidine possibly delayed by octreotide
  $5HT_1$ Agonists: cimetidine inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
  Mebendazole: cimetidine possibly inhibits metabolism of mebendazole (increased plasma concentration)
  Roflumilast: cimetidine inhibits the metabolism of roflumilast
  Sildenafil: cimetidine increases plasma concentration of sildenafil (consider reducing dose of sildenafil)
- Theophylline: cimetidine inhibits metabolism of ●theophylline (increased plasma concentration)
  Thyroid Hormones: cimetidine reduces absorption of levothyroxine
- Ulipristal: avoidance of histamine H_2-antagonists advised by manufacturer of ●ulipristal (plasma concentration of ulipristal possibly reduced)

Homatropine *see* Antimuscarinics

Hormone Antagonists *see* Bicalutamide, Danazol, Dutasteride, Exemestane, Flutamide, Lanreotide, Octreotide, Tamoxifen, Toremifene, and Trilostane

$5HT_1$ Agonists

- Antibacterials: plasma concentration of eletriptan increased by ●clarithromycin and ●erythromycin (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by quinolones (reduce dose of zolmitriptan)
- Antidepressants: increased risk of CNS toxicity when sumatriptan given with ●citalopram, ●escitalopram, ●fluoxetine, ●fluvoxamine or ●paroxetine; metabolism of frovatriptan inhibited by fluvoxamine; metabolism of zolmitriptan possibly inhibited by fluvoxamine (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with sertraline; possible increased serotonergic effects when $5HT_1$ agonists given with duloxetine or venlafaxine; increased risk of CNS toxicity when zolmitriptan given with ●MAOIs; risk of CNS toxicity when rizatriptan or sumatriptan given with ●MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with ●moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when zolmitriptan given with ●moclobemide (reduce dose of zolmitriptan); increased serotonergic effects when $5HT_1$ agonists given with ●St John's wort—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by ●itraconazole and ●ketoconazole (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by ketoconazole (increased risk of toxicity)
- Antivirals: plasma concentration of eletriptan increased by ●indinavir, ●nelfinavir and ●ritonavir (risk of toxicity)—avoid concomitant use
  Beta-blockers: plasma concentration of rizatriptan increased by propranolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
  Dopaminergics: avoidance of $5HT_1$ agonists advised by manufacturer of selegiline

$5HT_1$ Agonists *(continued)*

- Ergot Alkaloids: increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ●ergotamine and methysergide (avoid ergotamine and methysergide for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine and methysergide); increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ●ergotamine and methysergide (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide)
  Lithium: possible risk of toxicity when sumatriptan given with lithium
  Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

$5HT_3$ Antagonists

Analgesics: ondansetron possibly antagonises effects of tramadol
Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)
Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)

Hydralazine *see* Vasodilator Antihypertensives

Hydrochlorothiazide *see* Diuretics

Hydrocortisone *see* Corticosteroids

Hydroflumethiazide *see* Diuretics

Hydromorphone *see* Opioid Analgesics

Hydrotalcite *see* Antacids

Hydroxocobalamin

Antibacterials: response to hydroxocobalamin reduced by chloramphenicol

Hydroxycarbamide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: increased risk of toxicity when hydroxycarbamide given with ●didanosine and ●stavudine—avoid concomitant use

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Hydroxychloroquine *see* Chloroquine and Hydroxychloroquine

Hydroxyzine *see* Antihistamines

Hyoscine *see* Antimuscarinics

Ibandronic Acid *see* Bisphosphonates

Ibuprofen *see* NSAIDs

Idarubicin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Ciclosporin: plasma concentration of idarubicin increased by ●ciclosporin

Ifosfamide

- Anticoagulants: ifosfamide possibly enhances anticoagulant effect of ●coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: increased risk of otoxicity when ifosfamide given with cisplatin

Iloprost

Analgesics: increased risk of bleeding when iloprost given with NSAIDs or aspirin
Anticoagulants: iloprost possibly enhances anticoagulant effect of coumarins and heparins;

Iloprost

Anticoagulants *(continued)*
increased risk of bleeding when iloprost given with phenindione
Clopidogrel: increased risk of bleeding when iloprost given with clopidogrel
Eptifibatide: increased risk of bleeding when iloprost given with eptifibatide
Tirofiban: increased risk of bleeding when iloprost given with tirofiban

Imatinib

Analgesics: manufacturer of imatinib advises caution with paracetamol
- Antibacterials: plasma concentration of imatinib reduced by •rifampicin—avoid concomitant use

Anticoagulants: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect)
- Antidepressants: plasma concentration of imatinib reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of imatinib reduced by •carbamazepine, •oxcarbazepine and •phenytoin—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin

Antifungals: plasma concentration of imatinib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ciclosporin: imatinib possibly increases plasma concentration of ciclosporin
Lipid-regulating Drugs: imatinib increases plasma concentration of simvastatin
Thyroid Hormones: imatinib possibly reduces plasma concentration of levothyroxine

Imidapril *see* ACE Inhibitors

Imipenem with Cilastatin
- Antiepileptics: carbapenems reduce plasma concentration of •valproate—avoid concomitant use
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with •ganciclovir

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Imipramine *see* Antidepressants, Tricyclic

Immunoglobulins

Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 769

Indacaterol *see* Sympathomimetics, $Beta_2$

Indapamide *see* Diuretics

Indinavir

Aldesleukin: plasma concentration of indinavir possibly increased by aldesleukin
- Anti-arrhythmics: indinavir possibly increases plasma concentration of •amiodarone—avoid concomitant use; indinavir possibly increases plasma concentration of •flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of •rifabutin—avoid concomitant use; metabolism of indinavir accelerated by •rifampicin (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: avoidance of indinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of indinavir reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by •carbamazepine and •phenytoin, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by •primidone
- Antifungals: plasma concentration of indinavir increased by •itraconazole and •ketoconazole (consider reducing dose of indinavir)

Indinavir *(continued)*
- Antimalarials: caution with indinavir advised by manufacturer of artemether/lumefantrine; indinavir possibly increases plasma concentration of •quinine (increased risk of toxicity)

Antimuscarinics: avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when indinavir given with fesoterodine—consult fesoterodine product literature
- Antipsychotics: indinavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); indinavir possibly increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoid concomitant use of indinavir with •atazanavir; plasma concentration of both drugs increased when indinavir given with darunavir; plasma concentration of indinavir reduced by efavirenz and nevirapine; plasma concentration of indinavir possibly reduced by •etravirine—avoid concomitant use; indinavir increases plasma concentration of •maraviroc (consider reducing dose of maraviroc); combination of indinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of indinavir increased by ritonavir; indinavir increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with •alprazolam—avoid concomitant use; indinavir possibly increases plasma concentration of •midazolam (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)

Atovaquone: plasma concentration of indinavir possibly reduced by atovaquone
- Barbiturates: plasma concentration of indinavir possibly reduced by •barbiturates; plasma concentration of indinavir possibly reduced by •phenobarbital, also plasma concentration of phenobarbital possibly increased
- Ciclosporin: indinavir increases plasma concentration of •ciclosporin
- Colchicine: indinavir possibly increases risk of •colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
- Cytotoxics: indinavir possibly increases plasma concentration of •everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of indinavir advised by manufacturer of •pazopanib
- Ergot Alkaloids: increased risk of ergotism when indinavir given with •ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: indinavir increases plasma concentration of •eletriptan (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with •simvastatin (avoid concomitant use)
- Ranolazine: indinavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: indinavir increases plasma concentration of •sildenafil—reduce initial dose of sildenafil

Tadalafil: indinavir possibly increases plasma concentration of tadalafil
- Vardenafil: indinavir increases plasma concentration of •vardenafil—avoid concomitant use

Indometacin *see* NSAIDs

Indoramin *see* Alpha-blockers

Infliximab
- Abatacept: avoid concomitant use of infliximab with •abatacept
- Anakinra: avoid concomitant use of infliximab with •anakinra
- Vaccines: avoid concomitant use of infliximab with live •vaccines (see p. 746)

Influenza Vaccine *see* Vaccines

Insulin *see* Antidiabetics

Interferon Alfa *see* Interferons

Interferon Gamma *see* Interferons

Interferons

Note Peginterferon alfa interactions as for interferon alfa
- Antivirals: increased risk of peripheral neuropathy when interferon alfa given with •telbivudine
- Theophylline: interferon alfa inhibits metabolism of •theophylline (consider reducing dose of theophylline)

Vaccines: manufacturer of interferon gamma advises avoid concomitant use with vaccines

Ipratropium *see* Antimuscarinics

Irbesartan *see* Angiotensin-II Receptor Antagonists

Irinotecan
- Antidepressants: metabolism of irinotecan accelerated by •St John's wort (reduced plasma concentration—avoid concomitant use)

Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by carbamazepine and phenytoin; cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of irinotecan reduced by •ketoconazole (but concentration of active metabolite of irinotecan increased)—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by •atazanavir (increased risk of toxicity)

Barbiturates: plasma concentration of irinotecan and its active metabolite reduced by phenobarbital

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: plasma concentration of active metabolite of irinotecan increased by •lapatinib—consider reducing dose of irinotecan; plasma concentration of irinotecan possibly increased by sorafenib

Iron

Antacids: absorption of *oral* iron reduced by oral magnesium salts (as magnesium trisilicate)

Antibacterials: *oral* iron reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; *oral* iron reduces absorption of tetracyclines, also absorption of *oral* iron reduced by tetracyclines

Bisphosphonates: *oral* iron reduces absorption of bisphosphonates

Calcium Salts: absorption of *oral* iron reduced by calcium salts
- Dimercaprol: avoid concomitant use of iron with •dimercaprol

Dopaminergics: *oral* iron reduces absorption of entacapone; *oral* iron possibly reduces absorption of levodopa

Eltrombopag: *oral* iron possibly reduces absorption of eltrombopag (give at least 4 hours apart)

Methyldopa: *oral* iron antagonises hypotensive effect of methyldopa

Mycophenolate: *oral* iron reduces absorption of mycophenolate

Penicillamine: *oral* iron reduces absorption of penicillamine

Thyroid Hormones: *oral* iron reduces absorption of levothyroxine (give at least 2 hours apart)

Trientine: absorption of *oral* iron reduced by trientine

Zinc: *oral* iron reduces absorption of zinc, also absorption of *oral* iron reduced by zinc

Isocarboxazid *see* MAOIs

Isoflurane *see* Anaesthetics, General

Isometheptene *see* Sympathomimetics

Isoniazid

Antacids: absorption of isoniazid reduced by antacids

Antibacterials: increased risk of CNS toxicity when isoniazid given with cycloserine
- Antiepileptics: isoniazid increases plasma concentration of •carbamazepine (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of •ethosuximide (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of phenytoin (increased risk of toxicity)

Antifungals: isoniazid possibly reduces plasma concentration of ketoconazole

Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of diazepam

Corticosteroids: plasma concentration of isoniazid possibly reduced by corticosteroids

Disulfiram: isoniazid possibly increases CNS effects of disulfiram

Dopaminergics: isoniazid possibly reduces effects of levodopa

Theophylline: isoniazid possibly increases plasma concentration of theophylline

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Isosorbide Dinitrate *see* Nitrates

Isosorbide Mononitrate *see* Nitrates

Isotretinoin *see* Retinoids

Isradipine *see* Calcium-channel Blockers

Itraconazole *see* Antifungals, Triazole

Ivabradine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with •amiodarone or •disopyramide
- Antibacterials: plasma concentration of ivabradine possibly increased by •clarithromycin and •telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with •erythromycin—avoid concomitant use

Antidepressants: plasma concentration of ivabradine reduced by St John's wort—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by •ketoconazole—avoid concomitant use; plasma concentration of ivabradine increased by fluconazole—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by •itraconazole—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with •mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with •pimozide
- Antivirals: plasma concentration of ivabradine possibly increased by •nelfinavir and •ritonavir—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with •sotalol
- Calcium-channel Blockers: plasma concentration of ivabradine increased by •diltiazem and •verapamil—avoid concomitant use

Grapefruit Juice: plasma concentration of ivabradine increased by grapefruit juice
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with •pentamidine isetionate

Kaolin

Analgesics: kaolin possibly reduces absorption of aspirin

Antibacterials: kaolin possibly reduces absorption of tetracyclines

Antimalarials: kaolin reduces absorption of chloroquine and hydroxychloroquine

Antipsychotics: kaolin possibly reduces absorption of phenothiazines

Ketamine *see* Anaesthetics, General

Ketoconazole *see* Antifungals, Imidazole

Ketoprofen *see* NSAIDs

Ketorolac *see* NSAIDs

Ketotifen *see* Antihistamines

Labetalol *see* Beta-blockers

Lacidipine *see* Calcium-channel Blockers

Lacosamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

Lactulose

Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins

Lamivudine

Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole

Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine; manufacturer of lamivudine advises avoid concomitant use with foscarnet; manufacturer of lamivudine advises avoid concomitant use of *intravenous* ganciclovir

Lamotrigine

- Antibacterials: plasma concentration of lamotrigine reduced by ●rifampicin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort

Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by phenytoin and primidone; plasma concentration of lamotrigine increased by valproate

- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine

Antivirals: plasma concentration of lamotrigine possibly reduced by ritonavir

Barbiturates: plasma concentration of lamotrigine reduced by phenobarbital

- Oestrogens: plasma concentration of lamotrigine reduced by ●oestrogens—consider increasing dose of lamotrigine
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

Progestogens: plasma concentration of lamotrigine possibly increased by desogestrel

Lanreotide

Antidiabetics: lanreotide possibly reduces requirements for insulin, metformin, repaglinide and sulfonylureas

Ciclosporin: lanreotide reduces plasma concentration of ciclosporin

Lansoprazole *see* Proton Pump Inhibitors

Lanthanum

Antibacterials: lanthanum possibly reduces absorption of quinolones (give at least 2 hours before or 4 hours after lanthanum)

Antifungals: lanthanum possibly reduces absorption of ketoconazole (give at least 2 hours apart)

Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)

Lanthanum *(continued)*

Thyroid Hormones: lanthanum reduces absorption of levothyroxine (give at least 2 hours apart)

Lapatinib

- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ●rifabutin, ●rifampicin and ●telithromycin
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with ●St John's wort
- Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ●repaglinide
- Antiepileptics: plasma concentration of lapatinib reduced by ●carbamazepine—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin; manufacturer of lapatinib advises avoid concomitant use with ●phenytoin
- Antifungals: plasma concentration of lapatinib increased by ●ketoconazole—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ●itraconazole, ●posaconazole and ●voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with ●pimozide
- Antivirals: manufacturer of lapatinib advises avoid concomitant use with ●ritonavir and ●saquinavir

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Cytotoxics: lapatinib increases plasma concentration of pazopanib; possible increased risk of neutropenia when lapatinib given with docetaxel; increased risk of neutropenia when lapatinib given with ●paclitaxel; lapatinib increases plasma concentration of active metabolite of ●irinotecan—consider reducing dose of irinotecan
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with ●grapefruit juice

Ulcer-healing Drugs: absorption of lapatinib possibly reduced by histamine H_2-antagonists and proton pump inhibitors

Laronidase

Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)

Leflunomide

Note Increased risk of toxicity with other haematotoxic and hepatotoxic drugs

Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by rifampicin

Anticoagulants: leflunomide possibly enhances anticoagulant effect of warfarin

Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of tolbutamide

Antiepileptics: leflunomide possibly increases plasma concentration of phenytoin

- Cytotoxics: risk of toxicity when leflunomide given with ●methotrexate

Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired

- Vaccines: avoid concomitant use of leflunomide with live ●vaccines (see p. 746)

Lenalidomide

Cardiac Glycosides: lenalidomide possibly increases plasma concentration of digoxin

Lercanidipine *see* Calcium-channel Blockers

Leukotriene Receptor Antagonists

Analgesics: plasma concentration of zafirlukast increased by aspirin

Antibacterials: plasma concentration of zafirlukast reduced by erythromycin

Anticoagulants: zafirlukast enhances anticoagulant effect of warfarin

Antiepileptics: plasma concentration of montelukast reduced by primidone

Leukotriene Receptor Antagonists *(continued)*
Barbiturates: plasma concentration of montelukast reduced by phenobarbital
Theophylline: zafirlukast possibly increases plasma concentration of theophylline, also plasma concentration of zafirlukast reduced

Levamisole
Alcohol: possibility of disulfiram-like reaction when levamisole given with alcohol
- Anticoagulants: levamisole possibly enhances anticoagulant effect of •warfarin

Antiepileptics: levamisole possibly increases plasma concentration of phenytoin

Levetiracetam
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

Antiepileptics: levetiracetam possibly increases risk of carbamazepine toxicity
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Levobunolol *see* Beta-blockers

Levobupivacaine
Anti-arrhythmics: increased myocardial depression when levobupivacaine given with anti-arrhythmics

Levocetirizine *see* Antihistamines

Levodopa
ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers
Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with •volatile liquid general anaesthetics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with angiotensin-II receptor antagonists
Antibacterials: effects of levodopa possibly reduced by isoniazid
- Antidepressants: risk of hypertensive crisis when levodopa given with •MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with moclobemide

Antiepileptics: effects of levodopa possibly reduced by phenytoin
Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics
Antipsychotics: effects of levodopa antagonised by antipsychotics; avoidance of levodopa advised by manufacturer of amisulpride (antagonism of effect)
Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by benzodiazepines
Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers
Bupropion: increased risk of side-effects when levodopa given with bupropion
Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when levodopa given with clonidine
Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide
Diuretics: enhanced hypotensive effect when levodopa given with diuretics

Levodopa *(continued)*
Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)
Iron: absorption of levodopa possibly reduced by *oral* iron
Memantine: effects of dopaminergics possibly enhanced by memantine
Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine
Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen
Nitrates: enhanced hypotensive effect when levodopa given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside
Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofloxacin *see* Quinolones

Levofolinic Acid *see* Folates

Levomepromazine *see* Antipsychotics

Levonorgestrel *see* Progestogens

Levothyroxine *see* Thyroid Hormones

Lidocaine
Note Interactions less likely when lidocaine used topically
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other •anti-arrhythmics
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by •atazanavir and lopinavir; plasma concentration of lidocaine possibly increased by darunavir and •fosamprenavir—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with •saquinavir—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with •beta-blockers; increased risk of lidocaine toxicity when given with •propranolol
- Diuretics: action of lidocaine antagonised by hypokalaemia caused by •acetazolamide, •loop diuretics or •thiazides and related diuretics

Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with suxamethonium
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by •cimetidine (increased risk of toxicity)

Linezolid
Note Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs
Antibacterials: plasma concentration of linezolid reduced by rifampicin (possible therapeutic failure of linezolid)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Liothyronine *see* Thyroid Hormones

Lipid-regulating Drugs *see* Colestipol, Colestyramine, Ezetimibe, Fibrates, Nicotinic Acid, and Statins

Liraglutide *see* Antidiabetics

Lisinopril *see* ACE Inhibitors

Lithium
- ACE Inhibitors: excretion of lithium reduced by •ACE inhibitors (increased plasma concentration)
- Analgesics: excretion of lithium reduced by •NSAIDs (increased risk of toxicity); excretion of lithium

Lithium

- Analgesics *(continued)*
  reduced by •ketorolac (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by •angiotensin-II receptor antagonists (increased plasma concentration)

Antacids: excretion of lithium increased by sodium bicarbonate (reduced plasma concentration)

- Anti-arrhythmics: avoidance of lithium advised by manufacturer of •amiodarone (risk of ventricular arrhythmias)

Antibacterials: increased risk of lithium toxicity when given with metronidazole

- Antidepressants: possible increased serotonergic effects when lithium given with venlafaxine; increased risk of CNS effects when lithium given with •SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics

Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine or phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by topiramate

Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol; possible risk of toxicity when lithium given with olanzapine; increased risk of extrapyramidal side-effects when lithium given with sulpiride

Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with clonazepam

Calcium-channel Blockers: neurotoxicity may occur when lithium given with diltiazem or verapamil without increased plasma concentration of lithium

- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with •arsenic trioxide
- Diuretics: excretion of lithium increased by •acetazolamide; excretion of lithium reduced by •loop diuretics and •thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by •potassium-sparing diuretics and aldosterone antagonists (increased plasma concentration and risk of toxicity)

5HT$_1$ Agonists: possible risk of toxicity when lithium given with sumatriptan

- Methyldopa: neurotoxicity may occur when lithium given with •methyldopa without increased plasma concentration of lithium

Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesis caused by lithium possibly aggravated by baclofen

Parasympathomimetics: lithium antagonises effects of neostigmine and pyridostigmine

Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration)

Lofepramine *see* Antidepressants, Tricyclic

Lofexidine

Alcohol: increased sedative effect when lofexidine given with alcohol

Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with anxiolytics and hypnotics

Barbiturates: increased sedative effect when lofexidine given with barbiturates

Lomustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by cimetidine

Loperamide

Desmopressin: loperamide increases plasma concentration of *oral* desmopressin

Lopinavir

Note In combination with ritonavir as *Kaletra*® (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of •flecainide (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of lidocaine
- Antibacterials: plasma concentration of lopinavir reduced by •rifampicin—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: avoidance of lopinavir advised by manufacturer of rivaroxaban

- Antidepressants: plasma concentration of lopinavir reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by carbamazepine, phenytoin and •primidone

Antihistamines: lopinavir possibly increases plasma concentration of chlorphenamine

Antimalarials: caution with lopinavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of lopinavir advised by manufacturer of darifenacin and tolterodine

- Antipsychotics: lopinavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole)
- Antivirals: lopinavir reduces plasma concentration of •darunavir, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by •efavirenz—consider increasing dose of lopinavir; lopinavir reduces plasma concentration of fosamprenavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of •maraviroc (consider reducing dose of maraviroc); plasma concentration of lopinavir reduced by nelfinavir, also plasma concentration of active metabolite of nelfinavir increased; plasma concentration of lopinavir possibly reduced by •nevirapine—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with •saquinavir—avoid concomitant use; lopinavir increases plasma concentration of tenofovir; plasma concentration of lopinavir reduced by •tipranavir
- Barbiturates: plasma concentration of lopinavir possibly reduced by •phenobarbital

Corticosteroids: plasma concentration of lopinavir possibly reduced by dexamethasone

Eltrombopag: lopinavir possibly reduces plasma concentration of eltrombopag

- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with atorvastatin; possible increased risk of myopathy when lopinavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when lopinavir given with •simvastatin—avoid concomitant use
- Ranolazine: lopinavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sirolimus: lopinavir possibly increases plasma concentration of sirolimus

Loprazolam *see* Anxiolytics and Hypnotics

Loratadine *see* Antihistamines

Lorazepam *see* Anxiolytics and Hypnotics

Lormetazepam *see* Anxiolytics and Hypnotics

Losartan *see* Angiotensin-II Receptor Antagonists

Lumefantrine *see* Artemether with Lumefantrine

Lymecycline *see* Tetracyclines

Macrolides

Note *See also* Telithromycin

Note Interactions do not apply to small amounts of erythromycin used topically

Analgesics: erythromycin increases plasma concentration of alfentanil

Antacids: absorption of azithromycin reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●amiodarone—avoid concomitant use; erythromycin increases plasma concentration of ●disopyramide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of ●disopyramide (increased risk of toxicity); erythromycin possibly increases plasma concentration of ●dronedarone (increased risk of ventricular arrhythmias—avoid concomitant use); avoidance of clarithromycin advised by manufacturer of ●dronedarone (risk of ventricular arrhythmias)
- Antibacterials: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●moxifloxacin—avoid concomitant use; macrolides possibly increase plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); clarithromycin increases plasma concentration of ●rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of clarithromycin reduced by rifamycins
- Anticoagulants: clarithromycin and erythromycin enhance anticoagulant effect of ●coumarins; azithromycin possibly enhances anticoagulant effect of ●coumarins
- Antidepressants: avoidance of macrolides advised by manufacturer of ●reboxetine

Antidiabetics: clarithromycin enhances effects of repaglinide

- Antiepileptics: clarithromycin and erythromycin increase plasma concentration of ●carbamazepine; clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration)

Antifungals: clarithromycin increases plasma concentration of itraconazole

- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of ●mizolastine (avoid concomitant use); erythromycin inhibits metabolism of ●mizolastine—avoid concomitant use; erythromycin increases plasma concentration of rupatadine
- Antimalarials: avoidance of macrolides advised by manufacturer of ●artemether/lumefantrine

Antimuscarinics: erythromycin possibly increases plasma concentration of darifenacin; manufacturer of fesoterodine advises dose reduction when clarithromycin given with fesoterodine—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of tolterodine

- Antipsychotics: avoidance of macrolides advised by manufacturer of ●droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●zuclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●amisulpride—avoid concomitant use; erythromycin possibly increases plasma concentration of ●clozapine (possible increased risk of convulsions); increased risk of ventricular arrhythmias when clarithromycin given with ●pimozide—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with ●pimozide—avoid concomitant use; macrolides possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●sulpiride

Macrolides *(continued)*

- Antivirals: plasma concentration of both drugs increased when clarithromycin given with atazanavir; increased risk of rash when clarithromycin given with efavirenz; clarithromycin increases plasma concentration of ●etravirine, also plasma concentration of clarithromycin reduced; clarithromycin possibly increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); plasma concentration of clarithromycin reduced by nevirapine (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; plasma concentration of clarithromycin increased by ●ritonavir (reduce dose of clarithromycin in renal impairment); plasma concentration of azithromycin and erythromycin possibly increased by ritonavir; increased risk of ventricular arrhythmias when clarithromycin or erythromycin given with ●saquinavir—avoid concomitant use; plasma concentration of clarithromycin increased by ●tipranavir (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of zidovudine (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of ●midazolam (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspirone (reduce dose of buspirone); erythromycin inhibits the metabolism of zopiclone

Aprepitant: clarithromycin possibly increases plasma concentration of aprepitant

- Atomoxetine: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●atomoxetine
- Calcium-channel Blockers: erythromycin possibly inhibits metabolism of felodipine (increased plasma concentration); avoidance of erythromycin advised by manufacturer of lercanidipine; clarithromycin and erythromycin possibly inhibit metabolism of ●verapamil (increased risk of toxicity)

Cardiac Glycosides: macrolides increase plasma concentration of digoxin (increased risk of toxicity)

- Ciclosporin: macrolides possibly inhibit metabolism of ●ciclosporin (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ●ciclosporin (increased plasma concentration)

Cilostazol: erythromycin increases plasma concentration of cilostazol (consider reducing dose of cilostazol)

- Clopidogrel: erythromycin possibly reduces antiplatelet effect of ●clopidogrel
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; erythromycin inhibits the metabolism of methylprednisolone; clarithromycin possibly increases plasma concentration of methylprednisolone

- Cytotoxics: clarithromycin possibly increases plasma concentration of ●everolimus—manufacturer of everolimus advises avoid concomitant use; erythromycin increases plasma concentration of ●everolimus; avoidance of clarithromycin advised by manufacturer of ●nilotinib and ●pazopanib; *in vitro* studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with ●arsenic trioxide; erythromycin increases toxicity of ●vinblastine—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with ●vinorelbine
- Diuretics: clarithromycin increases plasma concentration of ●eplerenone—avoid concomitant use;

Macrolides

- Diuretics *(continued)*
  erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone)

  Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity); erythromycin increases plasma concentration of bromocriptine and cabergoline (increased risk of toxicity)
- Ergot Alkaloids: increased risk of ergotism when macrolides given with ●ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: clarithromycin and erythromycin increase plasma concentration of ●eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of ●ivabradine—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ●ivabradine—avoid concomitant use

  Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of zafirlukast
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of ●atorvastatin and pravastatin; possible increased risk of myopathy when erythromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with ●simvastatin (avoid concomitant use)

  Parasympathomimetics: erythromycin increases plasma concentration of galantamine
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with ●pentamidine isetionate
- Ranolazine: clarithromycin possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: clarithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil; erythromycin increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: clarithromycin increases plasma concentration of ●sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with ●sirolimus
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of ●tacrolimus

  Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil
- Theophylline: azithromycin possibly increases plasma concentration of theophylline; clarithromycin inhibits metabolism of ●theophylline (increased plasma concentration); erythromycin inhibits metabolism of ●theophylline (increased plasma concentration), if erythromycin given *by mouth*, also decreased plasma-erythromycin concentration

  Ulcer-healing Drugs: plasma concentration of erythromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole

  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

  Vardenafil: erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil)

Magnesium (parenteral)

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and ●nifedipine in pre-eclampsia

  Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium

Magnesium Salts (oral) *see* Antacids

Mannitol

Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with ciclosporin

MAOIs

Note For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with adrenergic neurone blockers

- Alcohol: MAOIs interact with tyramine found in some beverages containing ●alcohol and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect

  $Alpha_2$-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine
- Alpha-blockers: avoidance of MAOIs advised by manufacturer of ●indoramin; enhanced hypotensive effect when MAOIs given with alpha-blockers
- Analgesics: CNS excitation or depression (hypertension or hypotension) when MAOIs given with ●pethidine—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with ●tramadol—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of ●nefopam; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with ●opioid analgesics—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs

  Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of angiotensin-II receptor antagonists
- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with ●reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start ●citalopram, ●escitalopram, ●fluvoxamine, ●paroxetine or ●sertraline for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start ●fluoxetine for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start ●duloxetine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with ●venlafaxine (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other ●MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start ●moclobemide for at least 1 week; MAOIs increase CNS effects of ●SSRIs (risk of serious toxicity); after stopping MAOIs do not start ●mirtazapine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start ●tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with ●tricyclics, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); CNS excitation and confusion when MAOIs given with ●tryptophan (reduce dose of tryptophan)

MAOIs *(continued)*

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulfonylureas

- Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of •carbamazepine, also antagonism of anticonvulsant effect

Antihistamines: increased antimuscarinic and sedative effects when MAOIs given with antihistamines

- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics

- Antipsychotics: CNS effects of MAOIs possibly increased by •clozapine

Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of buspirone; manufacturer of tranylcypromine advises avoid buspirone for 10 days after stopping tranylcypromine

- Atomoxetine: after stopping MAOIs do not start •atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: MAOIs possibly antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered)

Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of •bupropion

Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when MAOIs given with clonidine

Diazoxide: enhanced hypotensive effect when MAOIs given with diazoxide

Diuretics: enhanced hypotensive effect when MAOIs given with diuretics

- Dopaminergics: avoid concomitant use of non-selective MAOIs with •entacapone; risk of hypertensive crisis when MAOIs given with •levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with •rasagiline, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with •selegiline—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with tolcapone

Doxapram: MAOIs enhance effects of doxapram

Histamine: avoidance of MAOIs advised by manufacturer of histamine

- $5HT_1$ Agonists: risk of CNS toxicity when MAOIs given with •rizatriptan or •sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when MAOIs given with •zolmitriptan
- Methyldopa: avoidance of MAOIs advised by manufacturer of •methyldopa

Moxonidine: enhanced hypotensive effect when MAOIs given with moxonidine

Muscle Relaxants: phenelzine enhances effects of suxamethonium

Nicorandil: enhanced hypotensive effect when MAOIs given with nicorandil

Nitrates: enhanced hypotensive effect when MAOIs given with nitrates

Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of pholcodine

- Sympathomimetics: risk of hypertensive crisis when MAOIs given with •sympathomimetics; risk of

MAOIs

- Sympathomimetics *(continued)*

hypertensive crisis when MAOIs given with •methylphenidate, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs

- Tetrabenazine: risk of CNS excitation and hypertension when MAOIs given with •tetrabenazine

Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with hydralazine, minoxidil or sodium nitroprusside

MAOIs, reversible *see* Moclobemide

Maraviroc

- Antibacterials: plasma concentration of maraviroc possibly increased by •clarithromycin and •telithromycin (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by •rifampicin—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by •St John's wort—avoid concomitant use
- Antifungals: plasma concentration of maraviroc increased by •ketoconazole (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by •atazanavir, •darunavir, •indinavir, •lopinavir and •saquinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by •efavirenz—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by etravirine; plasma concentration of maraviroc possibly increased by •nelfinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc increased by ritonavir

Mebendazole

Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by cimetidine (increased plasma concentration)

Medroxyprogesterone *see* Progestogens

Mefenamic Acid *see* NSAIDs

Mefloquine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with •amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with •moxifloxacin—avoid concomitant use; plasma concentration of mefloquine reduced by •rifampicin—avoid concomitant use
- Antiepileptics: mefloquine antagonises anticonvulsant effect of •antiepileptics

Antifungals: plasma concentration of mefloquine increased by ketoconazole

- Antimalarials: avoidance of antimalarials advised by manufacturer of •artemether/lumefantrine; increased risk of convulsions when mefloquine given with •chloroquine and hydroxychloroquine; increased risk of convulsions when mefloquine given with •quinine (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with •haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when mefloquine given with •pimozide—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with •atomoxetine

Beta-blockers: increased risk of bradycardia when mefloquine given with beta-blockers

Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with calcium-channel blockers

Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with digoxin

Mefloquine *(continued)*
Histamine: avoidance of antimalarials advised by manufacturer of histamine
• Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with •ivabradine
Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Megestrol *see* Progestogens

Melatonin *see* Anxiolytics and Hypnotics

Meloxicam *see* NSAIDs

Melphalan
Antibacterials: increased risk of melphalan toxicity when given with nalidixic acid
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
• Ciclosporin: increased risk of nephrotoxicity when melphalan given with •ciclosporin

Memantine
• Anaesthetics, General: increased risk of CNS toxicity when memantine given with •ketamine (manufacturer of memantine advises avoid concomitant use)
• Analgesics: increased risk of CNS toxicity when memantine given with •dextromethorphan (manufacturer of memantine advises avoid concomitant use)
Anticoagulants: memantine possibly enhances anticoagulant effect of warfarin
Antiepileptics: memantine possibly reduces effects of primidone
Antimuscarinics: memantine possibly enhances effects of antimuscarinics
Antipsychotics: memantine possibly reduces effects of antipsychotics
Barbiturates: memantine possibly reduces effects of barbiturates
• Dopaminergics: memantine possibly enhances effects of dopaminergics and selegiline; increased risk of CNS toxicity when memantine given with •amantadine (manufacturer of memantine advises avoid concomitant use)
Muscle Relaxants: memantine possibly modifies effects of baclofen and dantrolene

Mepacrine
Antimalarials: mepacrine increases plasma concentration of primaquine (increased risk of toxicity)

Meprobamate *see* Anxiolytics and Hypnotics

Meptazinol *see* Opioid Analgesics

Mercaptopurine
• Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with •allopurinol (reduce dose of mercaptopurine to one quarter of usual dose)
Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with aminosalicylates
• Antibacterials: increased risk of haematological toxicity when mercaptopurine given with •sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with •trimethoprim (also with co-trimoxazole)
• Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of •coumarins
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
• Febuxostat: avoidance of mercaptopurine advised by manufacturer of •febuxostat

Meropenem
• Antiepileptics: carbapenems reduce plasma concentration of •valproate—avoid concomitant use

Meropenem *(continued)*
Probenecid: excretion of meropenem reduced by probenecid
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Mesalazine *see* Aminosalicylates

Mestranol *see* Oestrogens

Metaraminol *see* Sympathomimetics

Metformin *see* Antidiabetics

Methadone *see* Opioid Analgesics

Methenamine
Antacids: avoid concomitant use of methenamine with antacids
• Antibacterials: increased risk of crystalluria when methenamine given with •sulfonamides
• Diuretics: effects of methenamine antagonised by •acetazolamide
Potassium Salts: avoid concomitant use of methenamine with potassium citrate
Sodium Citrate: avoid concomitant use of methenamine with sodium citrate
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Methocarbamol *see* Muscle Relaxants

Methotrexate
• Anaesthetics, General: antifolate effect of methotrexate increased by •nitrous oxide—avoid concomitant use
• Analgesics: excretion of methotrexate probably reduced by •NSAIDs (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; excretion of methotrexate reduced by •aspirin, •diclofenac, •ibuprofen, •indometacin, •ketoprofen, •meloxicam and •naproxen (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647
• Antibacterials: absorption of methotrexate possibly reduced by neomycin; excretion of methotrexate possibly reduced by ciprofloxacin (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with •sulfamethoxazole (as co-trimoxazole); increased risk of methotrexate toxicity when given with doxycycline, sulfonamides or tetracycline; excretion of methotrexate reduced by penicillins (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with •trimethoprim (also with co-trimoxazole)
Antiepileptics: antifolate effect of methotrexate increased by phenytoin; cytotoxics possibly reduce absorption of phenytoin
• Antimalarials: antifolate effect of methotrexate increased by •pyrimethamine
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
• Ciclosporin: risk of toxicity when methotrexate given with •ciclosporin
• Cytotoxics: increased pulmonary toxicity when methotrexate given with •cisplatin
Diuretics: excretion of methotrexate increased by alkaline urine due to acetazolamide
• Leflunomide: risk of toxicity when methotrexate given with •leflunomide
• Probenecid: excretion of methotrexate reduced by •probenecid (increased risk of toxicity)
• Retinoids: plasma concentration of methotrexate increased by •acitretin (also increased risk of hepatotoxicity)—avoid concomitant use
Theophylline: methotrexate possibly increases plasma concentration of theophylline
Ulcer-healing Drugs: excretion of methotrexate possibly reduced by omeprazole (increased risk of toxicity)

Methoxamine *see* Sympathomimetics

Methyldopa
ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when methyldopa given with alcohol
Aldesleukin: enhanced hypotensive effect when methyldopa given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when methyldopa given with general anaesthetics
Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin-II receptor antagonists
• Antidepressants: manufacturer of methyldopa advises avoid concomitant use with •MAOIs
Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics (also increased risk of extrapyramidal effects)
Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when methyldopa given with clonidine
Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide
Diuretics: enhanced hypotensive effect when methyldopa given with diuretics
Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics; increased risk of extrapyramidal side-effects when methyldopa given with amantadine; effects of methyldopa possibly enhanced by entacapone; enhanced hypotensive effect when methyldopa given with levodopa
Iron: hypotensive effect of methyldopa antagonised by *oral* iron
• Lithium: neurotoxicity may occur when methyldopa given with •lithium without increased plasma concentration of lithium
Moxisylyte: enhanced hypotensive effect when methyldopa given with moxisylyte
Moxonidine: enhanced hypotensive effect when methyldopa given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when methyldopa given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when methyldopa given with nitrates
Oestrogens: hypotensive effect of methyldopa antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when methyldopa given with alprostadil
• Sympathomimetics, Beta$_2$: acute hypotension reported when methyldopa given with *infusion* of •salbutamol
Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with hydralazine, minoxidil or sodium nitroprusside

Methylphenidate *see* Sympathomimetics

Methylprednisolone *see* Corticosteroids

Methysergide *see* Ergot Alkaloids

Metipranolol *see* Beta-blockers

Metoclopramide
Anaesthetics, General: metoclopramide enhances effects of thiopental
Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol
Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by antimuscarinics
Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics
Atovaquone: metoclopramide reduces plasma concentration of atovaquone
• Ciclosporin: metoclopramide increases plasma concentration of •ciclosporin
Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of bromocriptine and cabergoline; metoclopramide antagonises antiparkinsonian effect of pergolide; avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (antagonism of effect)
Muscle Relaxants: metoclopramide enhances effects of suxamethonium
Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with tetrabenazine

Metolazone *see* Diuretics

Metoprolol *see* Beta-blockers

Metronidazole
Note Interactions do not apply to topical metronidazole preparations
Alcohol: disulfiram-like reaction when metronidazole given with alcohol
• Anticoagulants: metronidazole enhances anticoagulant effect of •coumarins
• Antiepileptics: metronidazole inhibits metabolism of •phenytoin (increased plasma concentration); metabolism of metronidazole accelerated by primidone (reduced plasma concentration)
Barbiturates: metabolism of metronidazole accelerated by barbiturates (reduced plasma concentration)
• Cytotoxics: metronidazole increases plasma concentration of •busulfan (increased risk of toxicity); metronidazole inhibits metabolism of fluorouracil (increased toxicity)
Disulfiram: psychotic reaction reported when metronidazole given with disulfiram
Lithium: metronidazole increases risk of lithium toxicity
Mycophenolate: metronidazole possibly reduces bioavailability of mycophenolate
Ulcer-healing Drugs: metabolism of metronidazole inhibited by cimetidine (increased plasma concentration)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Mianserin *see* Antidepressants, Tricyclic (related)

Micafungin
Antifungals: micafungin possibly increases plasma concentration of amphotericin; micafungin increases plasma concentration of itraconazole (consider reducing dose of itraconazole)
Calcium-channel Blockers: micafungin increases plasma concentration of nifedipine
Ciclosporin: micafungin possibly increases plasma concentration of ciclosporin
Sirolimus: micafungin increases plasma concentration of sirolimus

Miconazole *see* Antifungals, Imidazole

Midazolam *see* Anxiolytics and Hypnotics

Mifamurtide
Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of NSAIDs
Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with ciclosporin
Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with corticosteroids

Mifamurtide *(continued)*
Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with tacrolimus

Mifepristone
Corticosteroids: mifepristone may reduce effect of corticosteroids (including *inhaled* corticosteroids) for 3–4 days

Milrinone *see* Phosphodiesterase Inhibitors

Minocycline *see* Tetracyclines

Minoxidil *see* Vasodilator Antihypertensives

Mirtazapine
- Alcohol: increased sedative effect when mirtazapine given with •alcohol

Analgesics: possible increased serotonergic effects when mirtazapine given with tramadol
Anticoagulants: mirtazapine enhances anticoagulant effect of warfarin
- Antidepressants: possible increased serotonergic effects when mirtazapine given with fluoxetine, fluvoxamine or venlafaxine; mirtazapine should not be started until 2 weeks after stopping •MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start •moclobemide for at least 1 week

Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine and phenytoin
Antifungals: plasma concentration of mirtazapine increased by ketoconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with anxiolytics and hypnotics
Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
Ulcer-healing Drugs: plasma concentration of mirtazapine increased by cimetidine

Mitomycin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Mitotane
- Anticoagulants: mitotane possibly reduces anticoagulant effect of •coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Diuretics: manufacturer of mitotane advises avoid concomitant use of spironolactone (antagonism of effect)

Mitoxantrone
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ciclosporin: excretion of mitoxantrone reduced by ciclosporin (increased plasma concentration)

Mivacurium *see* Muscle Relaxants

Mizolastine *see* Antihistamines

Moclobemide
- Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with •dextromethorphan or •pethidine—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with •opioid analgesics—manufacturer of moclobemide advises consider reducing dose of opioid analgesics
- Antidepressants: moclobemide should not be started for at least 1 week after stopping •MAOIs, •SSRI-related antidepressants, •citalopram, •fluvoxamine, •mirtazapine, •paroxetine, •sertraline, •tricyclic-related antidepressants or •tricyclics; increased risk of CNS toxicity when moclobemide given with •escitalopram, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping •fluoxetine; possible increased serotonergic effects when moclobemide given with •duloxetine
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Bupropion: avoidance of moclobemide advised by manufacturer of •bupropion
- Clopidogrel: moclobemide possibly reduces antiplatelet effect of •clopidogrel
- Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with •selegiline
- 5HT$_1$ Agonists: risk of CNS toxicity when moclobemide given with •rizatriptan or •sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with •zolmitriptan (reduce dose of zolmitriptan)
- Sympathomimetics: risk of hypertensive crisis when moclobemide given with •sympathomimetics

Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)

Modafinil
Antiepileptics: modafinil possibly increases plasma concentration of phenytoin
- Ciclosporin: modafinil reduces plasma concentration of •ciclosporin
- Oestrogens: modafinil accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)

Moexipril *see* ACE Inhibitors

Mometasone *see* Corticosteroids

Monobactams *see* Aztreonam

Montelukast *see* Leukotriene Receptor Antagonists

Morphine *see* Opioid Analgesics

Moxifloxacin *see* Quinolones

Moxisylyte
ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with adrenergic neurone blockers
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with •alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
- Beta-blockers: possible severe postural hypotension when moxisylyte given with •beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
Methyldopa: enhanced hypotensive effect when moxisylyte given with methyldopa
Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
Nitrates: enhanced hypotensive effect when moxisylyte given with nitrates

Moxisylyte *(continued)*
Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with hydralazine, minoxidil or sodium nitroprusside

Moxonidine
ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when moxonidine given with alcohol
Aldesleukin: enhanced hypotensive effect when moxonidine given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when moxonidine given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when moxonidine given with general anaesthetics
Analgesics: hypotensive effect of moxonidine antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs; hypotensive effect of moxonidine possibly antagonised by tricyclics (manufacturer of moxonidine advises avoid concomitant use)
Antipsychotics: enhanced hypotensive effect when moxonidine given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with anxiolytics and hypnotics; sedative effects possibly increased when moxonidine given with benzodiazepines
Beta-blockers: enhanced hypotensive effect when moxonidine given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when moxonidine given with clonidine
Corticosteroids: hypotensive effect of moxonidine antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when moxonidine given with diazoxide
Diuretics: enhanced hypotensive effect when moxonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when moxonidine given with levodopa
Methyldopa: enhanced hypotensive effect when moxonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when moxonidine given with moxisylyte
Muscle Relaxants: enhanced hypotensive effect when moxonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when moxonidine given with nitrates
Oestrogens: hypotensive effect of moxonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when moxonidine given with alprostadil
Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with hydralazine, minoxidil or sodium nitroprusside

Muscle Relaxants
ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with adrenergic neurone blockers
Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with alcohol
Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with alpha-blockers
- Anaesthetics, General: effects of atracurium enhanced by ketamine; increased risk of myocardial depression and bradycardia when suxamethonium given with •propofol; effects of non-depolarising muscle relaxants and suxamethonium enhanced by volatile liquid general anaesthetics

Analgesics: excretion of baclofen possibly reduced by NSAIDs (increased risk of toxicity); excretion of baclofen reduced by ibuprofen (increased risk of toxicity); increased sedative effect when baclofen given with fentanyl or morphine
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with angiotensin-II receptor antagonists
Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with lidocaine
- Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by piperacillin; plasma concentration of tizanidine increased by •ciprofloxacin (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by norfloxacin (increased risk of toxicity); effects of non-depolarising muscle relaxants and suxamethonium enhanced by •aminoglycosides; effects of non-depolarising muscle relaxants and suxamethonium enhanced by •clindamycin; effects of non-depolarising muscle relaxants and suxamethonium enhanced by •polymyxins; effects of suxamethonium enhanced by •vancomycin
- Antidepressants: plasma concentration of tizanidine increased by •fluvoxamine (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by phenelzine; muscle relaxant effect of baclofen enhanced by tricyclics

Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by carbamazepine and phenytoin (accelerated recovery from neuromuscular blockade)
Antimalarials: effects of suxamethonium possibly enhanced by quinine
Antipsychotics: effects of suxamethonium possibly enhanced by promazine
Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when baclofen given with beta-blockers; possible enhanced hypotensive effect and bradycardia when tizanidine given with beta-blockers; effects of muscle relaxants enhanced by propranolol
Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with calcium-channel blockers; effects of non-depolarising muscle relaxants possibly enhanced by calcium-channel blockers; possible increased risk of ventricular arrhythmias when *intravenous* dantrolene given with diltiazem—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by verapamil; hypotension, myocardial depression, and hyperkalaemia when *intravenous* dantrolene given with verapamil
Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides
Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine
Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by corticosteroids
Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiotepa
Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide
Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics
Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa

Muscle Relaxants *(continued)*
Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesis caused by lithium
Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium
Memantine: effects of baclofen and dantrolene possibly modified by memantine
Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with methyldopa
Metoclopramide: effects of suxamethonium enhanced by metoclopramide
Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with moxonidine
Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with nitrates
Oestrogens: plasma concentration of tizanidine possibly increased by oestrogens (increased risk of toxicity)
Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants antagonised by edrophonium, neostigmine, pyridostigmine and rivastigmine; effects of suxamethonium enhanced by edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine
Progestogens: plasma concentration of tizanidine possibly increased by progestogens (increased risk of toxicity)
Sympathomimetics, $Beta_2$: effects of suxamethonium enhanced by bambuterol
Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with hydralazine; enhanced hypotensive effect when baclofen or tizanidine given with minoxidil; enhanced hypotensive effect when baclofen or tizanidine given with sodium nitroprusside

Muscle Relaxants, depolarising *see* Muscle Relaxants

Muscle Relaxants, non-depolarising *see* Muscle Relaxants

Mycophenolate
Antacids: absorption of mycophenolate reduced by antacids
- Antibacterials: bioavailability of mycophenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycophenolate reduced by •rifampicin

Antivirals: mycophenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of inactive metabolite of mycophenolate possibly increased
Iron: absorption of mycophenolate reduced by *oral* iron
Lipid-regulating Drugs: absorption of mycophenolate reduced by colestyramine
Sevelamer: plasma concentration of mycophenolate possibly reduced by sevelamer

Mycophenolate Mofetil *see* Mycophenolate

Mycophenolate Sodium *see* Mycophenolate

Mycophenolic Acid *see* Mycophenolate

Nabilone
Alcohol: increased sedative effect when nabilone given with alcohol
Anxiolytics and Hypnotics: increased sedative effect when nabilone given with anxiolytics and hypnotics

Nabumetone *see* NSAIDs

Nadolol *see* Beta-blockers

Nalidixic Acid *see* Quinolones

Nandrolone *see* Anabolic Steroids

Naproxen *see* NSAIDs

Naratriptan *see* $5HT_1$ Agonists

Nateglinide *see* Antidiabetics

Nebivolol *see* Beta-blockers

Nefopam
- Antidepressants: manufacturer of nefopam advises avoid concomitant use with •MAOIs; side-effects possibly increased when nefopam given with tricyclics

Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with antimuscarinics

Nelfinavir
Analgesics: nelfinavir reduces plasma concentration of methadone
- Anti-arrhythmics: increased risk of ventricular arrhythmias when nelfinavir given with •amiodarone—avoid concomitant use
- Antibacterials: nelfinavir increases plasma concentration of •rifabutin (halve dose of rifabutin); plasma concentration of nelfinavir significantly reduced by •rifampicin—avoid concomitant use; avoidance of concomitant nelfinavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin

Anticoagulants: avoidance of nelfinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of nelfinavir reduced by •St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of nelfinavir possibly reduced by carbamazepine and •primidone; nelfinavir reduces plasma concentration of phenytoin
- Antimalarials: caution with nelfinavir advised by manufacturer of artemether/lumefantrine; nelfinavir possibly increases plasma concentration of •quinine (increased risk of toxicity)

Antimuscarinics: avoidance of nelfinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when nelfinavir given with fesoterodine—consult fesoterodine product literature; nelfinavir increases plasma concentration of solifenacin
- Antipsychotics: nelfinavir possibly inhibits metabolism of •aripiprazole (reduce dose of aripiprazole); nelfinavir possibly increases plasma concentration of •pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: plasma concentration of nelfinavir possibly increased by etravirine—avoid concomitant use; combination of nelfinavir with indinavir or ritonavir may increase plasma concentration of either drug (or both); nelfinavir reduces plasma concentration of lopinavir, also plasma concentration of active metabolite of nelfinavir increased; nelfinavir possibly increases plasma concentration of •maraviroc (consider reducing dose of maraviroc); nelfinavir increases plasma concentration of •saquinavir—manufacturer of saquinavir advises avoid concomitant use
- Anxiolytics and Hypnotics: nelfinavir possibly increases plasma concentration of •midazolam (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)
- Barbiturates: plasma concentration of nelfinavir possibly reduced by •barbiturates
- Ciclosporin: nelfinavir possibly increases plasma concentration of •ciclosporin

Corticosteroids: nelfinavir possibly increases plasma concentration of *inhaled* and *intranasal* fluticasone
- Cytotoxics: nelfinavir possibly increases plasma concentration of •everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of nelfinavir advised by manufacturer of •pazopanib; nelfinavir increases plasma concentration of paclitaxel
- Diuretics: nelfinavir increases plasma concentration of •eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when nelfinavir given with •ergotamine and methysergide—avoid concomitant use

Nelfinavir *(continued)*
- 5HT$_1$ Agonists: nelfinavir increases plasma concentration of •eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: nelfinavir possibly increases plasma concentration of •ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when nelfinavir given with atorvastatin; possible increased risk of myopathy when nelfinavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when nelfinavir given with •simvastatin (avoid concomitant use)
- Oestrogens: nelfinavir accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)

  Progestogens: nelfinavir possibly reduces contraceptive effect of progestogens
- Ranolazine: nelfinavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Sildenafil: nelfinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Tacrolimus: nelfinavir possibly increases plasma concentration of •tacrolimus
- Ulcer-healing Drugs: plasma concentration of nelfinavir reduced by •omeprazole—avoid concomitant use

Neomycin *see* Aminoglycosides

Neostigmine *see* Parasympathomimetics

Nevirapine

Analgesics: nevirapine possibly reduces plasma concentration of methadone
- Antibacterials: nevirapine reduces plasma concentration of clarithromycin (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by •rifampicin—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of •warfarin
- Antidepressants: plasma concentration of nevirapine reduced by •St John's wort—avoid concomitant use

  Antiepileptics: plasma concentration of nevirapine reduced by carbamazepine
- Antifungals: nevirapine reduces plasma concentration of •ketoconazole—avoid concomitant use; plasma concentration of nevirapine increased by •fluconazole; nevirapine possibly reduces plasma concentration of caspofungin and itraconazole—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole
- Antivirals: nevirapine possibly reduces plasma concentration of •atazanavir and •etravirine—avoid concomitant use; nevirapine reduces plasma concentration of efavirenz and indinavir; nevirapine possibly reduces plasma concentration of fosamprenavir; nevirapine possibly reduces plasma concentration of •lopinavir—consider increasing dose of lopinavir
- Oestrogens: nevirapine accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Progestogens: nevirapine accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Nicardipine *see* Calcium-channel Blockers

Nicorandil

Alcohol: hypotensive effect of nicorandil possibly enhanced by alcohol

Antidepressants: enhanced hypotensive effect when nicorandil given with MAOIs; hypotensive effect of nicorandil possibly enhanced by tricyclics

Nicorandil *(continued)*
- Sildenafil: hypotensive effect of nicorandil significantly enhanced by •sildenafil (avoid concomitant use)
- Tadalafil: hypotensive effect of nicorandil significantly enhanced by •tadalafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nicorandil given with •vardenafil—avoid concomitant use

  Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with hydralazine, minoxidil or sodium nitroprusside

Nicotine

Anti-arrhythmics: nicotine possibly enhances effects of adenosine

Nicotinic Acid

Note Interactions apply to lipid-regulating doses of nicotinic acid
- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with •statins (applies to lipid regulating doses of nicotinic acid)

Nifedipine *see* Calcium-channel Blockers

Nilotinib
- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with •clarithromycin and •telithromycin; plasma concentration of nilotinib reduced by •rifampicin—avoid concomitant use

  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of nilotinib increased by •ketoconazole—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with •itraconazole and •voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of nilotinib advises avoid concomitant use with •ritonavir

  Anxiolytics and Hypnotics: nilotinib increases plasma concentration of midazolam

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with •grapefruit juice

Nimodipine *see* Calcium-channel Blockers

Nitrates

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgesics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)
- Anticoagulants: *infusion* of glyceryl trinitrate reduces anticoagulant effect of •heparins

  Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

  Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Nitrates *(continued)*
Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when nitrates given with clonidine
Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide
Diuretics: enhanced hypotensive effect when nitrates given with diuretics
Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa
Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa
Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte
Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine
Oestrogens: hypotensive effect of nitrates antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil
- Sildenafil: hypotensive effect of nitrates significantly enhanced by •sildenafil (avoid concomitant use)
- Tadalafil: hypotensive effect of nitrates significantly enhanced by •tadalafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nitrates given with •vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

Nitrazepam *see* Anxiolytics and Hypnotics

Nitrofurantoin
Antacids: absorption of nitrofurantoin reduced by oral magnesium salts (as magnesium trisilicate)
Antibacterials: nitrofurantoin possibly antagonises effects of nalidixic acid
Probenecid: excretion of nitrofurantoin reduced by probenecid (increased risk of side-effects)
Sulfinpyrazone: excretion of nitrofurantoin reduced by sulfinpyrazone (increased risk of toxicity)
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Nitroimidazoles *see* Metronidazole and Tinidazole

Nitrous Oxide *see* Anaesthetics, General

Nizatidine *see* Histamine H_2-antagonists

Noradrenaline (norepinephrine) *see* Sympathomimetics

Norelgestromin *see* Progestogens

Norepinephrine (noradrenaline) *see* Sympathomimetics

Norethisterone *see* Progestogens

Norfloxacin *see* Quinolones

Norgestimate *see* Progestogens

Norgestrel *see* Progestogens

Nortriptyline *see* Antidepressants, Tricyclic

NSAIDs
Note *See also* Aspirin. Interactions do not generally apply to topical NSAIDs
ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised
Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
Aliskiren: NSAIDs possibly antagonise hypotensive effect of aliskiren

NSAIDs *(continued)*
Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers
- Analgesics: avoid concomitant use of NSAIDs with •NSAIDs or •aspirin (increased side-effects); avoid concomitant use of NSAIDs with •ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of aspirin

Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised
- Antibacterials: indometacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with •quinolones
- Anticoagulants: increased risk of haemorrhage when *intravenous* diclofenac given with •anticoagulants (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with •anticoagulants (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of •coumarins and •phenindione; possible increased risk of bleeding when NSAIDs given with •dabigatran etexilate or heparins
- Antidepressants: increased risk of bleeding when NSAIDs given with •SSRIs or •venlafaxine
- Antidiabetics: NSAIDs possibly enhance effects of •sulfonylureas

Antifungals: plasma concentration of parecoxib increased by fluconazole (reduce dose of parecoxib); plasma concentration of celecoxib increased by fluconazole (halve dose of celecoxib); plasma concentration of diclofenac and ibuprofen increased by voriconazole
Antipsychotics: possible severe drowsiness when indometacin given with haloperidol
- Antivirals: plasma concentration of piroxicam increased by •ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of NSAIDs possibly increased by ritonavir; increased risk of haematological toxicity when NSAIDs given with zidovudine

Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers
Bisphosphonates: indometacin increases bioavailability of tiludronic acid
Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers
Cardiac Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible exacerbation of heart failure and reduction of renal function
- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with •ciclosporin; plasma concentration of diclofenac increased by •ciclosporin (halve dose of diclofenac)

Clonidine: NSAIDs antagonise hypotensive effect of clonidine
Clopidogrel: increased risk of bleeding when NSAIDs given with clopidogrel
Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with corticosteroids
- Cytotoxics: NSAIDs probably reduce excretion of •methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of •methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; increased risk of bleeding when NSAIDs given with •erlotinib

Desmopressin: indometacin enhances effects of desmopressin

NSAIDs *(continued)*

Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide

- Dimethyl sulfoxide: avoid concomitant use of sulindac with •dimethyl sulfoxide
- Diuretics: risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; NSAIDs possibly antagonise diuretic effect of potassium canrenoate; occasional reports of reduced renal function when indometacin given with •triamterene—avoid concomitant use; possible increased risk of hyperkalaemia when NSAIDs given with potassium-sparing diuretics and aldosterone antagonists; increased risk of hyperkalaemia when indometacin given with potassium-sparing diuretics and aldosterone antagonists

Iloprost: increased risk of bleeding when NSAIDs given with iloprost

Lipid-regulating Drugs: excretion of meloxicam increased by colestyramine

- Lithium: NSAIDs reduce excretion of •lithium (increased risk of toxicity); ketorolac reduces excretion of •lithium (increased risk of toxicity)—avoid concomitant use

Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa

Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of mifamurtide

Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine

Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity)

Nitrates: NSAIDs antagonise hypotensive effect of nitrates

Oestrogens: etoricoxib increases plasma concentration of ethinylestradiol

Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with penicillamine

- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with pentoxifylline; increased risk of bleeding when ketorolac given with •pentoxifylline (avoid concomitant use)

Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel

- Probenecid: excretion of dexketoprofen, indometacin, ketoprofen and naproxen reduced by •probenecid (increased plasma concentration); excretion of ketorolac reduced by •probenecid (increased plasma concentration)—avoid concomitant use
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with •tacrolimus

Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Octreotide

Antidiabetics: octreotide possibly reduces requirements for insulin, metformin, repaglinide and sulfonylureas

- Ciclosporin: octreotide reduces plasma concentration of •ciclosporin

Dopaminergics: octreotide increases plasma concentration of bromocriptine

Ulcer-healing Drugs: octreotide possibly delays absorption of cimetidine

Oestrogens

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings

ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers

Oestrogens *(continued)*

Alpha-blockers: oestrogens antagonise hypotensive effect of alpha-blockers

Analgesics: plasma concentration of ethinylestradiol increased by etoricoxib

Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists

- Antibacterials: metabolism of oestrogens accelerated by •rifamycins (reduced contraceptive effect—see p. 495)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of •coumarins; oestrogens antagonise anticoagulant effect of •phenindione
- Antidepressants: contraceptive effect of oestrogens reduced by •St John's wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Antidiabetics: oestrogens antagonise hypoglycaemic effect of antidiabetics

- Antiepileptics: metabolism of oestrogens accelerated by •carbamazepine, •eslicarbazepine, •oxcarbazepine, •phenytoin, •primidone, •rufinamide and •topiramate (reduced contraceptive effect—see p. 495); oestrogens reduce plasma concentration of •lamotrigine—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of valproate

Antifungals: oestrogens increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with griseofulvin; anecdotal reports of contraceptive failure when oestrogens given with imidazoles; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine

- Antivirals: plasma concentration of ethinylestradiol increased by atazanavir; contraceptive effect of oestrogens possibly reduced by efavirenz; metabolism of oestrogens accelerated by •nelfinavir, •nevirapine and •ritonavir (reduced contraceptive effect—see p. 495)

Anxiolytics and Hypnotics: oestrogens increase plasma concentration of melatonin

- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with •aprepitant (alternative contraception recommended)
- Barbiturates: metabolism of oestrogens accelerated by •barbiturates (reduced contraceptive effect—see p. 495)

Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers

Bile Acids: elimination of cholesterol in bile increased when oestrogens given with bile acids

- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with •bosentan (alternative contraception recommended)

Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers

Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin

Clonidine: oestrogens antagonise hypotensive effect of clonidine

Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids

Diuretics: oestrogens antagonise diuretic effect of diuretics

- Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of •selegiline—manufacturer of selegiline advises avoid concomitant use

Lipid-regulating Drugs: absorption of ethinylestradiol reduced by colesevelam; plasma concentration of

Oestrogens

Lipid-regulating Drugs *(continued)* ethinylestradiol increased by atorvastatin and rosuvastatin

Methyldopa: oestrogens antagonise hypotensive effect of methyldopa

- Modafinil: metabolism of oestrogens accelerated by •modafinil (reduced contraceptive effect—see p. 495)

Moxonidine: oestrogens antagonise hypotensive effect of moxonidine

Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)

Nitrates: oestrogens antagonise hypotensive effect of nitrates

Sitaxentan: plasma concentration of oestrogens increased by sitaxentan

Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin

Sugammadex: plasma concentration of oestrogens possibly reduced by sugammadex

Tacrolimus: ethinylestradiol possibly increases plasma concentration of tacrolimus

Theophylline: oestrogens reduce excretion of theophylline (increased plasma concentration)

Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism

Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Oestrogens, conjugated *see* Oestrogens

Ofloxacin *see* Quinolones

Olanzapine *see* Antipsychotics

Olmesartan *see* Angiotensin-II Receptor Antagonists

Olsalazine *see* Aminosalicylates

Omeprazole *see* Proton Pump Inhibitors

Ondansetron *see* $5HT_3$ Antagonists

Opioid Analgesics

Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with alcohol

Anaesthetics, General: fentanyl inhibits metabolism of etomidate (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of intravenous general anaesthetics and volatile liquid general anaesthetics

Antibacterials: plasma concentration of alfentanil increased by erythromycin; avoidance of premedication with opioid analgesics advised by manufacturer of ciprofloxacin (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by rifampicin (reduced effect); metabolism of oxycodone possibly accelerated by rifampicin; metabolism of oxycodone inhibited by telithromycin

- Anticoagulants: tramadol enhances anticoagulant effect of •coumarins
- Antidepressants: plasma concentration of methadone possibly increased by fluoxetine, fluvoxamine, paroxetine and sertraline; possible increased serotonergic effects when pethidine or tramadol given with duloxetine; possible increased serotonergic effects when tramadol given with mirtazapine or venlafaxine; possible increased serotonergic effects and increased risk of convulsions when tramadol given with •MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with •MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with •MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS

Opioid Analgesics

- Antidepressants *(continued)* excitation or depression (hypertension or hypotension) when opioid analgesics given with •moclobemide—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with •moclobemide—avoid concomitant use; increased risk of CNS toxicity when tramadol given with •SSRIs or •tricyclics; plasma concentration of methadone possibly reduced by St John's wort; sedative effects possibly increased when opioid analgesics given with tricyclics
- Antiepileptics: dextropropoxyphene enhances effects of •carbamazepine; effects of tramadol reduced by carbamazepine; plasma concentration of methadone reduced by carbamazepine; morphine increases bioavailability of gabapentin; metabolism of methadone accelerated by phenytoin (reduced effect and risk of withdrawal effects); plasma concentration of methadone possibly reduced by primidone
- Antifungals: metabolism of buprenorphine inhibited by •ketoconazole (reduce dose of buprenorphine); metabolism of alfentanil inhibited by fluconazole (risk of prolonged or delayed respiratory depression); metabolism of alfentanil possibly inhibited by itraconazole; plasma concentration of alfentanil and methadone increased by •voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by •triazoles
- Antihistamines: sedative effects possibly increased when opioid analgesics given with •sedating antihistamines
- Antipsychotics: enhanced hypotensive and sedative effects when opioid analgesics given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with •antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with •amisulpride—avoid concomitant use
- Antivirals: plasma concentration of methadone possibly reduced by abacavir and nevirapine; methadone possibly reduces plasma concentration of didanosine; plasma concentration of methadone reduced by efavirenz, fosamprenavir, nelfinavir and ritonavir; plasma concentration of dextropropoxyphene increased by •ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; plasma concentration of alfentanil and fentanyl increased by •ritonavir; plasma concentration of pethidine reduced by •ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); plasma concentration of morphine possibly reduced by ritonavir; increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with •saquinavir—avoid concomitant use; buprenorphine possibly reduces plasma concentration of tipranavir; methadone possibly increases plasma concentration of zidovudine

Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of midazolam

- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with •atomoxetine; possible increased risk of convulsions when tramadol given with atomoxetine

Barbiturates: CNS effects of opioid analgesics possibly increased by barbiturates; plasma concentration of methadone reduced by phenobarbital

Opioid Analgesics *(continued)*
Beta-blockers: morphine possibly increases plasma concentration of esmolol
Calcium-channel Blockers: metabolism of alfentanil inhibited by diltiazem (risk of prolonged or delayed respiratory depression)
Domperidone: opioid analgesics antagonise effects of domperidone on gastro-intestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with •rasagiline; risk of CNS toxicity when pethidine given with •rasagiline (avoid pethidine for 2 weeks after rasagiline); hyperpyrexia and CNS toxicity reported when pethidine given with •selegiline (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of selegiline

$5HT_3$ Antagonists: effects of tramadol possibly antagonised by ondansetron
- Memantine: increased risk of CNS toxicity when dextromethorphan given with •memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide: opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity
Muscle Relaxants: increased sedative effect when fentanyl or morphine given with baclofen
- Sodium Oxybate: opioid analgesics enhance effects of •sodium oxybate (avoid concomitant use)

Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by cimetidine (increased plasma concentration)

Orlistat
Anti-arrhythmics: orlistat possibly reduces plasma concentration of amiodarone
Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of coumarins
Antidiabetics: manufacturer of orlistat advises avoid concomitant use with acarbose
- Antiepileptics: possible increased risk of convulsions when orlistat given with •antiepileptics
- Ciclosporin: orlistat possibly reduces absorption of •ciclosporin

Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with levothyroxine

Orphenadrine *see* Antimuscarinics
Oxaliplatin *see* Platinum Compounds
Oxandrolone *see* Anabolic Steroids
Oxazepam *see* Anxiolytics and Hypnotics

Oxcarbazepine
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of carbamazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of eslicarbazepine; oxcarbazepine increases plasma concentration of phenytoin, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of oxcarbazepine antagonised by •antipsychotics (convulsive threshold lowered)

Barbiturates: oxcarbazepine increases plasma concentration of phenobarbital, also plasma concentration of an active metabolite of oxcarbazepine reduced

Oxcarbazepine
Barbiturates *(continued)*
Ciclosporin: oxcarbazepine possibly reduces plasma concentration of ciclosporin
- Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of •clopidogrel
- Cytotoxics: oxcarbazepine reduces plasma concentration of •imatinib—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat
- Progestogens: oxcarbazepine accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Oxprenolol *see* Beta-blockers
Oxybutynin *see* Antimuscarinics
Oxycodone *see* Opioid Analgesics
Oxymetazoline *see* Sympathomimetics
Oxytetracycline *see* Tetracyclines

Oxytocin
Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics
Prostaglandins: uterotonic effect of oxytocin potentiated by prostaglandins
Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor sympathomimetics (due to enhanced vasopressor effect)

Paclitaxel
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Antivirals: plasma concentration of paclitaxel increased by nelfinavir and ritonavir
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased risk of neutropenia when paclitaxel given with •lapatinib

Paliperidone *see* Antipsychotics

Pancreatin
Antidiabetics: pancreatin antagonises hypoglycaemic effect of acarbose

Pancuronium *see* Muscle Relaxants
Pantoprazole *see* Proton Pump Inhibitors
Papaveretum *see* Opioid Analgesics

Paracetamol
Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of coumarins
Antiepileptics: metabolism of paracetamol possibly accelerated by carbamazepine
Cytotoxics: paracetamol possibly inhibits metabolism of *intravenous* busulfan (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of imatinib
Lipid-regulating Drugs: absorption of paracetamol reduced by colestyramine
Metoclopramide: rate of absorption of paracetamol increased by metoclopramide

Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with •alcohol
- Disulfiram: risk of toxicity when paraldehyde given with •disulfiram

Parasympathomimetics
Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by propafenone
- Antibacterials: plasma concentration of galantamine increased by erythromycin; effects of neostigmine and pyridostigmine antagonised by •aminoglycosides; effects of neostigmine and

Parasympathomimetics
- Antibacterials *(continued)*
  pyridostigmine antagonised by clindamycin; effects of neostigmine and pyridostigmine antagonised by •polymyxins
  Antidepressants: plasma concentration of galantamine increased by paroxetine
  Antifungals: plasma concentration of galantamine increased by ketoconazole
  Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis
  Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics
  Beta-blockers: increased risk of arrhythmias when pilocarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol
  Lithium: effects of neostigmine and pyridostigmine antagonised by lithium
  Muscle Relaxants: donepezil possibly enhances effects of suxamethonium; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of suxamethonium; donepezil possibly antagonises effects of non-depolarising muscle relaxants; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants

Parecoxib *see* NSAIDs

Paricalcitol *see* Vitamins

Paroxetine *see* Antidepressants, SSRI

Pazopanib
- Antibacterials: manufacturer of pazopanib advises avoid concomitant use with •clarithromycin, •rifampicin and •telithromycin
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: manufacturer of pazopanib advises avoid concomitant use with •itraconazole, •ketoconazole and •voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of pazopanib advises avoid concomitant use with •atazanavir, •indinavir, •nelfinavir, •ritonavir and •saquinavir
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
  Cytotoxics: plasma concentration of pazopanib increased by lapatinib
- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with •grapefruit juice

Pegfilgrastim *see* Filgrastim

Peginterferon Alfa *see* Interferons

Pemetrexed
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antimalarials: antifolate effect of pemetrexed increased by •pyrimethamine
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Penicillamine
  Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs
  Antacids: absorption of penicillamine reduced by antacids
- Antipsychotics: avoid concomitant use of penicillamine with •clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: penicillamine possibly reduces plasma concentration of digoxin
  Iron: absorption of penicillamine reduced by *oral* iron
  Sodium Aurothiomalate: manufacturer of penicillamine advises avoid concomitant use with sodium aurothiomalate (increased risk of toxicity)

Penicillamine *(continued)*
  Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins
  Allopurinol: increased risk of rash when amoxicillin or ampicillin given with allopurinol
  Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin; effects of penicillins possibly antagonised by tetracyclines
  Anticoagulants: common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin, although studies have failed to demonstrate an interaction with coumarins or phenindione
  Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)
  Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and suxamethonium
  Probenecid: excretion of penicillins reduced by probenecid (increased plasma concentration)
  Sulfinpyrazone: excretion of penicillins reduced by sulfinpyrazone
  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Pentamidine Isetionate
- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with •amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with *parenteral* •erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with •moxifloxacin—avoid concomitant use
- Antidepressants: increased risk of ventricular arrhythmias when pentamidine isetionate given with •tricyclics
  Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with amphotericin
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with •amisulpride or •droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with •phenothiazines
- Antivirals: increased risk of hypocalcaemia when *parenteral* pentamidine isetionate given with •foscarnet; increased risk of ventricular arrhythmias when pentamidine isetionate given with •saquinavir—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with •ivabradine

Pentazocine *see* Opioid Analgesics

Pentostatin
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased toxicity when pentostatin given with high-dose •cyclophosphamide—avoid concomitant use; increased pulmonary toxicity when pentostatin given with •fludarabine (unacceptably high incidence of fatalities)

Pentoxifylline
- Analgesics: possible increased risk of bleeding when pentoxifylline given with NSAIDs; increased risk of bleeding when pentoxifylline given with •ketorolac (avoid concomitant use)
  Theophylline: pentoxifylline increases plasma concentration of theophylline

Pergolide
  Antipsychotics: effects of pergolide antagonised by antipsychotics
  Memantine: effects of dopaminergics possibly enhanced by memantine

Pergolide *(continued)*
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: antiparkinsonian effect of pergolide antagonised by metoclopramide

Pericyazine *see* Antipsychotics

Perindopril *see* ACE Inhibitors

Perphenazine *see* Antipsychotics

Pethidine *see* Opioid Analgesics

Phenazocine *see* Opioid Analgesics

Phenelzine *see* MAOIs

Phenindione

Note Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of •alcohol
- Anabolic Steroids: anticoagulant effect of phenindione enhanced by •anabolic steroids
- Analgesics: anticoagulant effect of phenindione possibly enhanced by •NSAIDs; increased risk of haemorrhage when anticoagulants given with *intravenous* •diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with •aspirin (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by •amiodarone (enhanced anticoagulant effect)
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with •neomycin (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by levofloxacin and •tetracyclines; studies have failed to demonstrate an interaction with phenindione, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin; metabolism of phenindione possibly inhibited by sulfonamides
- Antivirals: anticoagulant effect of phenindione possibly enhanced by •ritonavir
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of •clopidogrel

Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by corticosteroids

- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of •dipyridamole
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some •enteral feeds)

Iloprost: increased risk of bleeding when phenindione given with iloprost

- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by •colestyramine; anticoagulant effect of phenindione possibly enhanced by •rosuvastatin; anticoagulant effect of phenindione enhanced by •fibrates
- Oestrogens: anticoagulant effect of phenindione antagonised by •oestrogens

Prasugrel: possible increased risk of bleeding when phenindione given with prasugrel

- Progestogens: anticoagulant effect of phenindione antagonised by •progestogens
- Testolactone: anticoagulant effect of phenindione enhanced by •testolactone
- Testosterone: anticoagulant effect of phenindione enhanced by •testosterone
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by •thyroid hormones
- Vitamins: anticoagulant effect of phenindione antagonised by •vitamin K

Phenobarbital *see* Barbiturates

Phenothiazines *see* Antipsychotics

Phenoxybenzamine *see* Alpha-blockers

Phenoxymethylpenicillin *see* Penicillins

Phentolamine *see* Alpha-blockers

Phenylephrine *see* Sympathomimetics

Phenytoin

Note Fosphenytoin interactions as for phenytoin

Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of alcohol
Analgesics: phenytoin accelerates metabolism of methadone (reduced effect and risk of withdrawal effects); effects of phenytoin enhanced by aspirin
Antacids: absorption of phenytoin reduced by antacids

- Anti-arrhythmics: metabolism of phenytoin inhibited by •amiodarone (increased plasma concentration); phenytoin reduces plasma concentration of disopyramide; phenytoin possibly reduces plasma concentration of •dronedarone—avoid concomitant use
- Antibacterials: metabolism of phenytoin inhibited by clarithromycin and •metronidazole (increased plasma concentration); plasma concentration of phenytoin increased or decreased by ciprofloxacin; phenytoin accelerates metabolism of doxycycline (reduced plasma concentration); plasma concentration of phenytoin increased by •chloramphenicol (increased risk of toxicity); metabolism of phenytoin possibly inhibited by isoniazid (increased risk of toxicity); metabolism of phenytoin accelerated by •rifamycins (reduced plasma concentration); plasma concentration of phenytoin possibly increased by sulfonamides; phenytoin reduces plasma concentration of •telithromycin (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by •trimethoprim (also increased antifolate effect)
- Anticoagulants: phenytoin accelerates metabolism of •coumarins (possibility of reduced anticoagulant effect, but enhancement also reported)
- Antidepressants: plasma concentration of phenytoin increased by •fluoxetine and •fluvoxamine; phenytoin reduces plasma concentration of •mianserin, mirtazapine and paroxetine; plasma concentration of phenytoin possibly increased by sertraline, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort; phenytoin possibly reduces plasma concentration of •tricyclics

Antidiabetics: plasma concentration of phenytoin transiently increased by tolbutamide (possibility of toxicity)

- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with carbamazepine, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of eslicarbazepine, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by •ethosuximide, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenytoin increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin possibly reduces plasma concentration of primidone (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of rufinamide, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased by •stiripentol; plasma concentration of phenytoin increased by •topiramate (also plasma concentration of topira-

Phenytoin

- Antiepileptics *(continued)*
  mate reduced); plasma concentration of phenytoin increased or possibly reduced when given with valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by vigabatrin
- Antifungals: phenytoin reduces plasma concentration of •ketoconazole and •posaconazole; anticonvulsant effect of phenytoin enhanced by •miconazole (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by •fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of •itraconazole—avoid concomitant use; plasma concentration of phenytoin increased by •voriconazole, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine; anticonvulsant effect of phenytoin antagonised by •pyrimethamine, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of phenytoin antagonised by •antipsychotics (convulsive threshold lowered); phenytoin reduces plasma concentration of haloperidol; plasma concentration of phenytoin possibly increased or decreased by chlorpromazine; phenytoin possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole; phenytoin accelerates metabolism of clozapine and quetiapine (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of etravirine; phenytoin possibly reduces plasma concentration of •indinavir, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin reduced by nelfinavir; phenytoin possibly reduces plasma concentration of ritonavir, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine

  Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of clonazepam; plasma concentration of phenytoin increased or decreased by diazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines

  Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant

  Barbiturates: phenytoin often increases plasma concentration of phenobarbital, plasma concentration of phenytoin often reduced but may be increased

  Bupropion: phenytoin reduces plasma concentration of bupropion
- Calcium-channel Blockers: phenytoin reduces effects of felodipine, isradipine and verapamil; phenytoin probably reduces effects of dihydropyridines, nicardipine and •nifedipine; plasma concentration of phenytoin increased by •diltiazem but also effect of diltiazem reduced

  Cardiac Glycosides: phenytoin possibly reduces plasma concentration of digoxin
- Ciclosporin: phenytoin accelerates metabolism of •ciclosporin (reduced plasma concentration)
- Corticosteroids: phenytoin accelerates metabolism of •corticosteroids (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration of busulfan and etoposide; metabolism of phenytoin possibly inhibited by fluorouracil (increased risk of toxicity); phenytoin increases antifolate effect of methotrexate; absorption of

Phenytoin

- Cytotoxics *(continued)*
  phenytoin possibly reduced by cytotoxics; avoidance of phenytoin advised by manufacturer of gefitinib and •lapatinib; phenytoin reduces plasma concentration of •imatinib—avoid concomitant use; phenytoin reduces plasma concentration of irinotecan and its active metabolite

  Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by •disulfiram (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by •acetazolamide; phenytoin antagonises effects of furosemide; phenytoin reduces plasma concentration of •eplerenone—avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbonic anhydrase inhibitors

  Dopaminergics: phenytoin possibly reduces effects of levodopa

  Enteral Foods: absorption of phenytoin possibly reduced by enteral feeds

  Folates: plasma concentration of phenytoin possibly reduced by folates

  Hormone Antagonists: phenytoin possibly accelerates metabolism of toremifene

  $5HT_3$ Antagonists: phenytoin accelerates metabolism of ondansetron (reduced effect)

  Leflunomide: plasma concentration of phenytoin possibly increased by leflunomide

  Levamisole: plasma concentration of phenytoin possibly increased by levamisole

  Lipid-regulating Drugs: absorption of phenytoin possibly reduced by colesevelam; combination of phenytoin with fluvastatin may increase plasma concentration of either drug (or both)

  Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium

  Modafinil: plasma concentration of phenytoin possibly increased by modafinil

  Muscle Relaxants: phenytoin antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)
- Oestrogens: phenytoin accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat
- Progestogens: phenytoin accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)
- Sulfinpyrazone: plasma concentration of phenytoin increased by •sulfinpyrazone

  Sympathomimetics: plasma concentration of phenytoin increased by methylphenidate

  Tacrolimus: phenytoin reduces plasma concentration of tacrolimus, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with •theophylline

  Thyroid Hormones: phenytoin accelerates metabolism of thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

  Tibolone: phenytoin accelerates metabolism of tibolone
- Ulcer-healing Drugs: metabolism of phenytoin inhibited by •cimetidine (increased plasma concentration); effects of phenytoin enhanced by •esomeprazole; effects of phenytoin possibly enhanced by omeprazole; absorption of phenytoin reduced by •sucralfate
- Ulipristal: avoidance of phenytoin advised by manufacturer of •ulipristal (contraceptive effect of ulipristal possibly reduced)

Phenytoin *(continued)*
Vaccines: effects of phenytoin enhanced by influenza vaccine
Vitamins: phenytoin possibly increases requirements for vitamin D

Pholcodine
Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping MAOIs

Phosphodiesterase Type-3 Inhibitors
- Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of ●anagrelide

Physostigmine *see* Parasympathomimetics

Pilocarpine *see* Parasympathomimetics

Pimozide *see* Antipsychotics

Pindolol *see* Beta-blockers

Pioglitazone *see* Antidiabetics

Piperacillin *see* Penicillins

Pipotiazine *see* Antipsychotics

Piroxicam *see* NSAIDs

Pivmecillinam *see* Penicillins

Pizotifen
Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of adrenergic neurone blockers

Platinum Compounds
- Aldesleukin: avoidance of cisplatin advised by manufacturer of ●aldesleukin
- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with ●aminoglycosides or ●polymyxins; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with vancomycin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased risk of otoxicity when cisplatin given with ifosfamide; increased pulmonary toxicity when cisplatin given with ●bleomycin and ●methotrexate

Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with diuretics

Polymyxin B *see* Polymyxins

Polymyxins
Antibacterials: increased risk of nephrotoxicity when colistin or polymyxins given with aminoglycosides; increased risk of nephrotoxicity when colistin or polymyxins given with capreomycin; increased risk of nephrotoxicity when polymyxins given with vancomycin; increased risk of nephrotoxicity and ototoxicity when colistin given with vancomycin

Antifungals: increased risk of nephrotoxicity when polymyxins given with amphotericin
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with ●ciclosporin
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with ●platinum compounds
- Diuretics: increased risk of otoxicity when polymyxins given with ●loop diuretics
- Muscle Relaxants: polymyxins enhance effects of ●non-depolarising muscle relaxants and ●suxamethonium
- Parasympathomimetics: polymyxins antagonise effects of ●neostigmine and ●pyridostigmine

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Polystyrene Sulphonate Resins
Antacids: risk of intestinal obstruction when polystyrene sulphonate resins given with aluminium hydroxide; risk of metabolic alkalosis when polystyrene sulphonate resins given with oral magnesium salts

Polystyrene Sulphonate Resins *(continued)*
Thyroid Hormones: polystyrene sulphonate resins reduce absorption of levothyroxine

Posaconazole *see* Antifungals, Triazole

Potassium Canrenoate *see* Diuretics

Potassium Aminobenzoate
Antibacterials: potassium aminobenzoate inhibits effects of sulfonamides

Potassium Bicarbonate *see* Potassium Salts

Potassium Chloride *see* Potassium Salts

Potassium Citrate *see* Potassium Salts

Potassium Salts
Note Includes salt substitutes
- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with ●ACE inhibitors

Aliskiren: increased risk of hyperkalaemia when potassium salts given with aliskiren
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with ●angiotensin-II receptor antagonists

Antibacterials: avoid concomitant use of potassium citrate with methenamine
- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with ●ciclosporin
- Diuretics: increased risk of hyperkalaemia when potassium salts given with ●potassium-sparing diuretics and aldosterone antagonists
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with ●tacrolimus

Pramipexole
Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of antipsychotics (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Ulcer-healing Drugs: excretion of pramipexole reduced by cimetidine (increased plasma concentration)

Prasugrel
Analgesics: possible increased risk of bleeding when prasugrel given with NSAIDs

Anticoagulants: possible increased risk of bleeding when prasugrel given with coumarins or phenindione

Clopidogrel: possible increased risk of bleeding when prasugrel given with clopidogrel

Pravastatin *see* Statins

Prazosin *see* Alpha-blockers

Prednisolone *see* Corticosteroids

Prednisone *see* Corticosteroids

Prilocaine
Anti-arrhythmics: increased myocardial depression when prilocaine given with anti-arrhythmics

Antibacterials: increased risk of methaemoglobinaemia when prilocaine given with sulfonamides

Primaquine
- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Mepacrine: plasma concentration of primaquine increased by mepacrine (increased risk of toxicity)

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Primidone
Alcohol: increased sedative effect when primidone given with alcohol

Analgesics: primidone possibly reduces plasma concentration of methadone

Anti-arrhythmics: primidone accelerates metabolism of disopyramide (reduced plasma concentration)
- Antibacterials: primidone accelerates metabolism of ●chloramphenicol, doxycycline and metronidazole (reduced plasma concentration); primidone reduces

Primidone

- Antibacterials *(continued)*
  plasma concentration of •telithromycin (avoid during and for 2 weeks after primidone)
- Anticoagulants: primidone accelerates metabolism of •coumarins (reduced anticoagulant effect)
- Antidepressants: primidone reduces plasma concentration of paroxetine; primidone accelerates metabolism of •mianserin (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort; anticonvulsant effect of primidone antagonised by •tricyclics (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Antiepileptics: primidone often reduces plasma concentration of carbamazepine, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); primidone possibly reduces plasma concentration of ethosuximide and rufinamide; primidone reduces plasma concentration of lamotrigine and tiagabine; plasma concentration of primidone possibly reduced by phenytoin (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; plasma concentration of primidone possibly increased by •valproate (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; plasma concentration of primidone possibly reduced by vigabatrin
- Antifungals: primidone possibly reduces plasma concentration of •posaconazole; primidone possibly reduces plasma concentration of •voriconazole—avoid concomitant use; primidone reduces absorption of griseofulvin (reduced effect)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of primidone antagonised by •antipsychotics (convulsive threshold lowered); primidone accelerates metabolism of haloperidol (reduced plasma concentration); primidone possibly reduces plasma concentration of •aripiprazole—increase dose of aripiprazole
- Antivirals: primidone possibly reduces plasma concentration of •indinavir, •lopinavir, •nelfinavir and •saquinavir

  Anxiolytics and Hypnotics: primidone often reduces plasma concentration of clonazepam

  Barbiturates: increased sedative effect when primidone given with barbiturates
- Calcium-channel Blockers: primidone reduces effects of •felodipine and •isradipine; primidone probably reduces effects of •dihydropyridines, •diltiazem and •verapamil
- Ciclosporin: primidone accelerates metabolism of •ciclosporin (reduced effect)
- Corticosteroids: primidone accelerates metabolism of •corticosteroids (reduced effect)

  Diuretics: plasma concentration of primidone possibly reduced by acetazolamide; increased risk of osteomalacia when primidone given with carbonic anhydrase inhibitors

  Folates: plasma concentration of primidone possibly reduced by folates

  Hormone Antagonists: primidone accelerates metabolism of toremifene (reduced plasma concentration)

  Leukotriene Receptor Antagonists: primidone reduces plasma concentration of montelukast

  Memantine: effects of primidone possibly reduced by memantine

Primidone *(continued)*

- Oestrogens: primidone accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat
- Progestogens: primidone accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

  Sympathomimetics: plasma concentration of primidone possibly increased by methylphenidate

  Theophylline: primidone accelerates metabolism of theophylline (reduced effect)

  Thyroid Hormones: primidone accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

  Tibolone: primidone accelerates metabolism of tibolone (reduced plasma concentration)

  Vitamins: primidone possibly increases requirements for vitamin D

Probenecid

ACE Inhibitors: probenecid reduces excretion of captopril

Anaesthetics, General: probenecid possibly enhances effects of thiopental

- Analgesics: probenecid reduces excretion of •dexketoprofen, •indometacin, •ketoprofen and •naproxen (increased plasma concentration); probenecid reduces excretion of •ketorolac (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by aspirin

  Antibacterials: probenecid reduces excretion of doripenem (manufacturers of doripenem advise avoid concomitant use); probenecid reduces excretion of meropenem; probenecid reduces excretion of cephalosporins, ciprofloxacin, nalidixic acid, norfloxacin and penicillins (increased plasma concentration); probenecid reduces excretion of dapsone and nitrofurantoin (increased risk of side-effects); effects of probenecid antagonised by pyrazinamide
- Antivirals: probenecid reduces excretion of aciclovir (increased plasma concentration); probenecid possibly reduces excretion of famciclovir (increased plasma concentration); probenecid reduces excretion of ganciclovir and •zidovudine (increased plasma concentration and risk of toxicity)

  Anxiolytics and Hypnotics: probenecid reduces excretion of lorazepam (increased plasma concentration); probenecid possibly reduces excretion of nitrazepam (increased plasma concentration)
- Cytotoxics: probenecid reduces excretion of •methotrexate (increased risk of toxicity)

  Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by sodium benzoate

  Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by sodium phenylbutyrate

Procarbazine

Alcohol: disulfiram-like reaction when procarbazine given with alcohol

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Prochlorperazine *see* Antipsychotics

Procyclidine *see* Antimuscarinics

Progesterone *see* Progestogens

Progestogens

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings

- Antibacterials: metabolism of progestogens accelerated by •rifamycins (reduced contraceptive effect—see p. 495)

Progestogens *(continued)*

- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of ●coumarins; progestogens antagonise anticoagulant effect of ●phenindione
- Antidepressants: contraceptive effect of progestogens reduced by ●St John's wort (avoid concomitant use)

  Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of progestogens accelerated by ●carbamazepine, ●eslicarbazepine, ●oxcarbazepine, ●phenytoin, ●primidone, ●rufinamide and ●topiramate (reduced contraceptive effect—see p. 495); desogestrel possibly increases plasma concentration of lamotrigine

  Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with griseofulvin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbinafine
- Antivirals: contraceptive effect of progestogens possibly reduced by ●efavirenz and nelfinavir; metabolism of progestogens accelerated by ●nevirapine (reduced contraceptive effect—see p. 495)
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with ●aprepitant (alternative contraception recommended)
- Barbiturates: metabolism of progestogens accelerated by ●barbiturates (reduced contraceptive effect—see p. 495)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with ●bosentan (alternative contraception recommended)
- Ciclosporin: progestogens inhibit metabolism of ●ciclosporin (increased plasma concentration)

  Diuretics: risk of hyperkalaemia when drospirenone given with potassium-sparing diuretics and aldosterone antagonists (monitor serum potassium during first cycle)
- Dopaminergics: progestogens increase plasma concentration of ●selegiline—manufacturer of selegiline advises avoid concomitant use

  Lipid-regulating Drugs: plasma concentration of norethisterone increased by atorvastatin; plasma concentration of norgestrel increased by rosuvastatin

  Muscle Relaxants: progestogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)

  Sitaxentan: plasma concentration of progestogens increased by sitaxentan

  Sugammadex: plasma concentration of progestogens possibly reduced by sugammadex
- Ulipristal: contraceptive effect of progestogens possibly reduced by ●ulipristal

Proguanil

Antacids: absorption of proguanil reduced by oral magnesium salts (as magnesium trisilicate)

Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of warfarin

- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased antifolate effect when proguanil given with pyrimethamine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Promazine *see* Antipsychotics

Promethazine *see* Antihistamines

Propafenone

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Propafenone *(continued)*

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●anti-arrhythmics
- Antibacterials: metabolism of propafenone accelerated by ●rifampicin (reduced effect)
- Anticoagulants: propafenone enhances anticoagulant effect of ●coumarins
- Antidepressants: metabolism of propafenone possibly inhibited by paroxetine (increased risk of toxicity); increased risk of arrhythmias when propafenone given with ●tricyclics
- Antihistamines: increased risk of ventricular arrhythmias when propafenone given with ●mizolastine—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of propafenone possibly increased by ●fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with ●saquinavir—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●beta-blockers; propafenone increases plasma concentration of metoprolol and propranolol
- Cardiac Glycosides: propafenone increases plasma concentration of ●digoxin (halve dose of digoxin)

  Ciclosporin: propafenone possibly increases plasma concentration of ciclosporin

  Parasympathomimetics: propafenone possibly antagonises effects of neostigmine and pyridostigmine

  Theophylline: propafenone increases plasma concentration of theophylline
- Ulcer-healing Drugs: plasma concentration of propafenone increased by ●cimetidine

Propantheline *see* Antimuscarinics

Propiverine *see* Antimuscarinics

Propofol *see* Anaesthetics, General

Propranolol *see* Beta-blockers

Prostaglandins

ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with adrenergic neurone blockers

Alpha-blockers: enhanced hypotensive effect when alprostadil given with alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with angiotensin-II receptor antagonists

Beta-blockers: enhanced hypotensive effect when alprostadil given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when alprostadil given with clonidine

Diazoxide: enhanced hypotensive effect when alprostadil given with diazoxide

Diuretics: enhanced hypotensive effect when alprostadil given with diuretics

Methyldopa: enhanced hypotensive effect when alprostadil given with methyldopa

Moxonidine: enhanced hypotensive effect when alprostadil given with moxonidine

Nitrates: enhanced hypotensive effect when alprostadil given with nitrates

Oxytocin: prostaglandins potentiate uterotonic effect of oxytocin

Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with hydralazine, minoxidil or sodium nitroprusside

Protein Kinase Inhibitors *see* Dasatinib, Erlotinib, Everolimus, Gefitinib, Imatinib, Lapatinib, Nilotinib, Pazopanib, Sorafenib, Sunitinib, and Temsirolimus

Proton Pump Inhibitors

Antacids: absorption of lansoprazole possibly reduced by antacids

Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin

- Anticoagulants: esomeprazole, omeprazole and pantoprazole possibly enhance anticoagulant effect of ●coumarins

Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine; plasma concentration of omeprazole possibly reduced by St John's wort

- Antiepileptics: esomeprazole enhances effects of ●phenytoin; omeprazole possibly enhances effects of phenytoin

Antifungals: proton pump inhibitors reduce absorption of itraconazole and ketoconazole; avoidance of proton pump inhibitors advised by manufacturer of posaconazole (plasma concentration of posaconazole possibly reduced); plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine

- Antivirals: proton pump inhibitors reduce plasma concentration of ●atazanavir—avoid or adjust dose of both drugs (consult product literature); omeprazole reduces plasma concentration of ●nelfinavir—avoid concomitant use; proton pump inhibitors possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; omeprazole increases plasma concentration of ●raltegravir—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of ●saquinavir—manufacturer of saquinavir advises avoid concomitant use; omeprazole increases plasma concentration of ●saquinavir—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by ●tipranavir

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of diazepam (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of digoxin

Ciclosporin: omeprazole possibly affects plasma concentration of ciclosporin

Cilostazol: omeprazole increases plasma concentration of cilostazol (consider reducing dose of cilostazol)

- Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of ●clopidogrel; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of clopidogrel
- Cytotoxics: omeprazole possibly reduces excretion of methotrexate (increased risk of toxicity); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of ●erlotinib; omeprazole reduces plasma concentration of ●erlotinib—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of lapatinib

Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by sucralfate

- Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of ●ulipristal (plasma concentration of ulipristal possibly reduced)

Pseudoephedrine *see* Sympathomimetics

Pyrazinamide

Probenecid: pyrazinamide antagonises effects of probenecid

Sulfinpyrazone: pyrazinamide antagonises effects of sulfinpyrazone

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Pyridostigmine *see* Parasympathomimetics

Pyridoxine *see* Vitamins

Pyrimethamine

- Antibacterials: increased antifolate effect when pyrimethamine given with ●sulfonamides or ●trimethoprim
- Antiepileptics: pyrimethamine antagonises anticonvulsant effect of ●phenytoin, also increased antifolate effect
- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased antifolate effect when pyrimethamine given with proguanil

Antivirals: increased antifolate effect when pyrimethamine given with zidovudine

- Cytotoxics: pyrimethamine increases antifolate effect of ●methotrexate and ●pemetrexed

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Quetiapine *see* Antipsychotics

Quinagolide

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Quinapril *see* ACE Inhibitors

Quinine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with ●amiodarone—avoid concomitant use; quinine increases plasma concentration of ●flecainide
- Antibacterials: increased risk of ventricular arrhythmias when quinine given with ●moxifloxacin—avoid concomitant use; plasma concentration of quinine reduced by ●rifampicin

Anticoagulants: plasma concentration of both drugs increased when quinine given with warfarin

- Antimalarials: avoidance of antimalarials advised by manufacturer of ●artemether/lumefantrine; increased risk of ventricular arrhythmias when quinine given with ●artemether/lumefantrine; increased risk of convulsions when quinine given with ●mefloquine (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: increased risk of ventricular arrhythmias when quinine given with ●droperidol or ●pimozide—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with ●haloperidol—avoid concomitant use
- Antivirals: plasma concentration of quinine possibly increased by ●atazanavir, ●darunavir, ●fosamprenavir, ●indinavir, ●nelfinavir and ●tipranavir (increased risk of toxicity); plasma concentration of quinine increased by ●ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with ●saquinavir—avoid concomitant use
- Cardiac Glycosides: quinine increases plasma concentration of ●digoxin

Dopaminergics: quinine possibly increases plasma concentration of amantadine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Muscle Relaxants: quinine possibly enhances effects of suxamethonium

Ulcer-healing Drugs: metabolism of quinine inhibited by cimetidine (increased plasma concentration)

Quinine *(continued)*

Vaccines: antimalarials inactivate oral typhoid vaccine–see p. 767

Quinolones

- Analgesics: possible increased risk of convulsions when quinolones given with •NSAIDs; manufacturer of ciprofloxacin advises avoid premedication with opioid analgesics (reduced plasma concentration of ciprofloxacin) when ciprofloxacin used for surgical prophylaxis

Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by antacids

- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with •amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with •disopyramide—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with *parenteral* •erythromycin—avoid concomitant use; effects of nalidixic acid possibly antagonised by nitrofurantoin
- Anticoagulants: ciprofloxacin, nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of •coumarins; levofloxacin possibly enhances anticoagulant effect of coumarins and phenindione
- Antidepressants: ciprofloxacin inhibits metabolism of •duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of •agomelatine; increased risk of ventricular arrhythmias when moxifloxacin given with •tricyclics—avoid concomitant use

Antidiabetics: norfloxacin possibly enhances effects of glibenclamide

Antiepileptics: ciprofloxacin increases or decreases plasma concentration of phenytoin

- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with •mizolastine—avoid concomitant use
- Antimalarials: avoidance of quinolones advised by manufacturer of •artemether/lumefantrine; increased risk of ventricular arrhythmias when moxifloxacin given with •chloroquine and hydroxychloroquine, •mefloquine or •quinine—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with •benperidol—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with •droperidol, •haloperidol, •phenothiazines, •pimozide or •zuclopenthixol—avoid concomitant use; ciprofloxacin increases plasma concentration of clozapine; ciprofloxacin possibly increases plasma concentration of olanzapine
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with •atomoxetine
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with •sotalol—avoid concomitant use

Calcium Salts: absorption of ciprofloxacin reduced by calcium salts

- Ciclosporin: increased risk of nephrotoxicity when quinolones given with •ciclosporin
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of •clopidogrel
- Cytotoxics: nalidixic acid increases risk of melphalan toxicity; ciprofloxacin possibly reduces excretion of methotrexate (increased risk of toxicity); ciprofloxacin increases plasma concentration of erlotinib; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with •arsenic trioxide

Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by dairy products

Dopaminergics: ciprofloxacin increases plasma concentration of rasagiline; ciprofloxacin inhibits metabolism of ropinirole (increased plasma concentration)

5HT$_1$ Agonists: quinolones possibly inhibit metabolism of zolmitriptan (reduce dose of zolmitriptan)

Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by *oral* iron

Lanthanum: absorption of quinolones possibly reduced by lanthanum (give at least 2 hours before or 4 hours after lanthanum)

- Muscle Relaxants: norfloxacin possibly increases plasma concentration of tizanidine (increased risk of toxicity); ciprofloxacin increases plasma concentration of •tizanidine (increased risk of toxicity)—avoid concomitant use

Mycophenolate: norfloxacin possibly reduces bioavailability of mycophenolate

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with •pentamidine isetionate—avoid concomitant use

Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by probenecid (increased plasma concentration)

Sevelamer: bioavailability of ciprofloxacin reduced by sevelamer

Strontium Ranelate: absorption of quinolones reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

- Theophylline: possible increased risk of convulsions when quinolones given with •theophylline; ciprofloxacin and norfloxacin increase plasma concentration of •theophylline

Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by sucralfate

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by zinc

Rabeprazole *see* Proton Pump Inhibitors

Raloxifene

Anticoagulants: raloxifene antagonises anticoagulant effect of coumarins

Lipid-regulating Drugs: absorption of raloxifene reduced by colestyramine (manufacturer of raloxifene advises avoid concomitant administration)

Raltegravir

- Antibacterials: plasma concentration of raltegravir reduced by •rifampicin—consider increasing dose of raltegravir
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by •omeprazole—avoid concomitant use; plasma concentration of raltegravir possibly increased by histamine H$_2$-antagonists and proton pump inhibitors—manufacturer of raltegravir advises avoid concomitant use

Raltitrexed

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

- Folates: manufacturer of raltitrexed advises avoid concomitant use with •folates

Ramipril *see* ACE Inhibitors

Ranitidine *see* Histamine H$_2$-antagonists

Ranolazine

- Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with •disopyramide
- Antibacterials: plasma concentration of ranolazine possibly increased by •clarithromycin and •telithromycin—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by •rifampicin—manufacturer of ranolazine advises avoid concomitant use

Ranolazine *(continued)*

Antidepressants: plasma concentration of ranolazine increased by paroxetine

- Antifungals: plasma concentration of ranolazine increased by •ketoconazole—avoid concomitant use; plasma concentration of ranolazine possibly increased by •itraconazole, •posaconazole and •voriconazole—manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by •atazanavir, •darunavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir, •saquinavir and •tipranavir—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with •sotalol

Calcium-channel Blockers: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)

Cardiac Glycosides: ranolazine increases plasma concentration of digoxin

Ciclosporin: plasma concentration of ranolazine possibly increased by ciclosporin

- Grapefruit Juice: plasma concentration of ranolazine possibly increased by •grapefruit juice—manufacturer of ranolazine advises avoid concomitant use

Lipid-regulating Drugs: ranolazine increases plasma concentration of simvastatin (consider reducing dose of simvastatin)

Rasagiline

Note Rasagiline is a MAO-B inhibitor

- Analgesics: avoid concomitant use of rasagiline with •dextromethorphan; risk of CNS toxicity when rasagiline given with •pethidine (avoid pethidine for 2 weeks after rasagiline)

Antibacterials: plasma concentration of rasagiline increased by ciprofloxacin

- Antidepressants: after stopping rasagiline do not start •fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start •fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with •MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with •SSRIs or •tricyclics

Dopaminergics: plasma concentration of rasagiline possibly reduced by entacapone

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

- Sympathomimetics: avoid concomitant use of rasagiline with •sympathomimetics

Reboxetine

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with •macrolides
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with •fluvoxamine; increased risk of hypertension and CNS excitation when reboxetine given with •MAOIs (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with •imidazoles and •triazoles
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics or thiazides and related diuretics

Ergot Alkaloids: possible risk of hypertension when reboxetine given with ergotamine and methysergide

Remifentanil *see* Opioid Analgesics

Repaglinide *see* Antidiabetics

Retinoids

- Alcohol: etretinate formed from acitretin in presence of •alcohol (increased risk of teratogenecity in women of child-bearing potential)
- Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with •tetracyclines (avoid concomitant use)
- Anticoagulants: acitretin possibly reduces anticoagulant effect of •coumarins

Antiepileptics: isotretinoin possibly reduces plasma concentration of carbamazepine

Antifungals: plasma concentration of alitretinoin increased by ketoconazole

- Cytotoxics: acitretin increases plasma concentration of •methotrexate (also increased risk of hepatotoxicity)—avoid concomitant use

Lipid-regulating Drugs: alitretinoin reduces plasma concentration of simvastatin

Vitamins: risk of hypervitaminosis A when retinoids given with vitamin A

Ribavirin

- Antivirals: effects of ribavirin possibly reduced by •abacavir; increased risk of side-effects when ribavirin given with •didanosine—avoid concomitant use; increased risk of toxicity when ribavirin given with •stavudine; increased risk of anaemia when ribavirin given with •zidovudine—avoid concomitant use
- Azathioprine: ribavirin possibly enhances myelosuppressive effects of •azathioprine

Rifabutin *see* Rifamycins

Rifampicin *see* Rifamycins

Rifamycins

ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of imidapril (reduced antihypertensive effect)

Analgesics: rifampicin reduces plasma concentration of celecoxib, diclofenac and etoricoxib; rifampicin accelerates metabolism of alfentanil, codeine, fentanyl, methadone and morphine (reduced effect); rifampicin possibly accelerates metabolism of oxycodone

Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of losartan and its active metabolite

Antacids: absorption of rifampicin reduced by antacids

- Anti-arrhythmics: rifamycins accelerate metabolism of •disopyramide (reduced plasma concentration); rifampicin reduces plasma concentration of •dronedarone—avoid concomitant use; rifampicin accelerates metabolism of •propafenone (reduced effect)
- Antibacterials: rifamycins reduce plasma concentration of clarithromycin and dapsone; plasma concentration of rifabutin increased by •clarithromycin (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of doxycycline—consider increasing dose of doxycycline; rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); rifampicin reduces plasma concentration of linezolid (possible therapeutic failure of linezolid); plasma concentration of rifabutin possibly increased by •macrolides (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of •telithromycin (avoid during and for 2 weeks after rifampicin); rifampicin possibly reduces plasma concentration of trimethoprim
- Anticoagulants: rifamycins accelerate metabolism of •coumarins (reduced anticoagulant effect); rifampicin reduces plasma concentration of rivaroxaban
- Antidiabetics: rifamycins accelerate metabolism of •tolbutamide (reduced effect); rifampicin reduces plasma concentration of nateglinide; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifamycins possibly accelerate metabolism of •sulfonylureas (reduced effect)

Rifamycins *(continued)*

- Antiepileptics: rifabutin reduces plasma concentration of •carbamazepine; rifampicin reduces plasma concentration of •lamotrigine; rifamycins accelerate metabolism of •phenytoin (reduced plasma concentration)
- Antifungals: rifampicin accelerates metabolism of •ketoconazole (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of rifabutin increased by •fluconazole (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of •fluconazole and •itraconazole (reduced plasma concentration); rifabutin reduces plasma concentration of •itraconazole—avoid concomitant use; plasma concentration of rifabutin increased by •posaconazole (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of •posaconazole and •terbinafine; plasma concentration of rifabutin increased by •voriconazole, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of •voriconazole—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of caspofungin (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by •triazoles (increased risk of uveitis—reduce rifabutin dose)

  Antihistamines: rifampicin possibly reduces effects of fexofenadine
- Antimalarials: rifampicin reduces plasma concentration of •mefloquine—avoid concomitant use; rifampicin reduces plasma concentration of •quinine

  Antimuscarinics: rifampicin reduces plasma concentration of active metabolite of fesoterodine
- Antipsychotics: rifampicin accelerates metabolism of •haloperidol (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of •aripiprazole—increase dose of aripiprazole; rifampicin possibly reduces plasma concentration of clozapine
- Antivirals: rifampicin possibly reduces plasma concentration of abacavir and ritonavir; rifampicin reduces plasma concentration of •atazanavir, •lopinavir and •nevirapine—avoid concomitant use; plasma concentration of rifabutin increased by •atazanavir, •darunavir, •fosamprenavir and •tipranavir (reduce dose of rifabutin); rifampicin significantly reduces plasma concentration of •darunavir, •fosamprenavir and •nelfinavir—avoid concomitant use; plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; rifampicin reduces plasma concentration of efavirenz—increase dose of efavirenz; plasma concentration of both drugs reduced when rifabutin given with •etravirine; avoidance of rifampicin advised by manufacturer of etravirine and zidovudine; rifampicin accelerates metabolism of •indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by •indinavir—avoid concomitant use; rifampicin reduces plasma concentration of •maraviroc and •raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin increased by •nelfinavir (halve dose of rifabutin); plasma concentration of rifabutin possibly increased by nevirapine; plasma concentration of rifabutin increased by •ritonavir (increased risk of toxicity); rifampicin significantly reduces plasma concentration of •saquinavir, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of rifabutin increased by •saquinavir (also plasma concentration of saquinavir reduced); rifampicin possibly reduces plasma concentration of •tipranavir—avoid concomitant use

Rifamycins *(continued)*

Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone and zaleplon; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone

Aprepitant: rifampicin reduces plasma concentration of aprepitant

- Atovaquone: rifabutin and rifampicin reduce plasma concentration of •atovaquone (possible therapeutic failure of atovaquone)

  Barbiturates: plasma concentration of rifampicin possibly reduced by phenobarbital

  Beta-blockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol
- Bosentan: rifampicin reduces plasma concentration of •bosentan—avoid concomitant use
- Calcium-channel Blockers: rifampicin possibly accelerates metabolism of •isradipine and •nicardipine (possible significantly reduced plasma concentration); rifampicin accelerates metabolism of •diltiazem, •nifedipine, •nimodipine and •verapamil (plasma concentration significantly reduced)

  Cardiac Glycosides: rifampicin possibly reduces plasma concentration of digoxin
- Ciclosporin: rifampicin accelerates metabolism of •ciclosporin (reduced plasma concentration)
- Corticosteroids: rifamycins accelerate metabolism of •corticosteroids (reduced effect)
- Cytotoxics: rifampicin accelerates metabolism of •dasatinib (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of erlotinib and sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of •everolimus and sorafenib; rifampicin reduces plasma concentration of •gefitinib, •imatinib and •nilotinib—avoid concomitant use; avoidance of rifabutin and rifampicin advised by manufacturer of •lapatinib; avoidance of rifampicin advised by manufacturer of •pazopanib; rifampicin reduces plasma concentration of active metabolite of •temsirolimus—avoid concomitant use; rifampicin possibly reduces plasma concentration of •vinflunine—manufacturer of vinflunine advises avoid concomitant use

  Deferasirox: rifampicin reduces plasma concentration of deferasirox
- Diuretics: rifampicin reduces plasma concentration of •eplerenone—avoid concomitant use

  Hormone Antagonists: rifampicin possibly reduces plasma concentration of exemestane; rifampicin accelerates metabolism of tamoxifen (reduced plasma concentration)

  $5HT_3$ Antagonists: rifampicin accelerates metabolism of ondansetron (reduced effect)

  Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of leflunomide

  Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of atorvastatin and simvastatin; rifampicin accelerates metabolism of fluvastatin (reduced effect)
- Mycophenolate: rifampicin reduces plasma concentration of active metabolite of •mycophenolate
- Oestrogens: rifamycins accelerate metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Progestogens: rifamycins accelerate metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Rifamycins *(continued)*
- Ranolazine: rifampicin reduces plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

  Roflumilast: rifampicin reduces plasma concentration of roflumilast—consider increasing dose of roflumilast
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: rifabutin possibly reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of ●tacrolimus
- Tadalafil: rifampicin reduces plasma concentration of ●tadalafil—manufacturer of tadalafil advises avoid concomitant use

  Theophylline: rifampicin accelerates metabolism of theophylline (reduced plasma concentration)

  Thyroid Hormones: rifampicin accelerates metabolism of levothyroxine (may increase requirements for levothyroxine in hypothyroidism)

  Tibolone: rifampicin accelerates metabolism of tibolone (reduced plasma concentration)

  Tolvaptan: rifampicin reduces plasma concentration of tolvaptan

  Ulcer-healing Drugs: rifampicin accelerates metabolism of cimetidine (reduced plasma concentration)
- Ulipristal: avoidance of rifampicin advised by manufacturer of ●ulipristal (contraceptive effect of ulipristal possibly reduced)

  Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Risedronate Sodium *see* Bisphosphonates

Risperidone *see* Antipsychotics

Ritodrine *see* Sympathomimetics, $Beta_2$

Ritonavir
- Alpha-blockers: ritonavir possibly increases plasma concentration of ●alfuzosin—avoid concomitant use
- Analgesics: ritonavir possibly increases plasma concentration of NSAIDs and buprenorphine; ritonavir increases plasma concentration of ●dextropropoxyphene and ●piroxicam (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of ●alfentanil and ●fentanyl; ritonavir reduces plasma concentration of methadone; ritonavir possibly reduces plasma concentration of morphine; ritonavir reduces plasma concentration of ●pethidine, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- Anti-arrhythmics: ritonavir increases plasma concentration of ●amiodarone and ●propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of ●disopyramide (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of ●dronedarone; ritonavir possibly increases plasma concentration of ●flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of azithromycin and erythromycin; ritonavir increases plasma concentration of ●clarithromycin (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of ●rifabutin (increased risk of toxicity); plasma concentration of ritonavir possibly reduced by rifampicin; plasma concentration of both drugs increased when ritonavir given with ●fusidic acid—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin
- Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of ●warfarin; ritonavir possibly enhances anticoagulant effect of ●coumarins and ●phenindione; ritonavir increases plasma concentration of ●rivaroxaban—manufacturer of rivaroxaban advises avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of paroxetine; ritonavir increases

Ritonavir
- Antidepressants *(continued)*
  plasma concentration of ●trazodone (increased risk of toxicity); ritonavir possibly increases plasma concentration of ●SSRIs and ●tricyclics; plasma concentration of ritonavir reduced by ●St John's wort—avoid concomitant use

  Antidiabetics: ritonavir possibly increases plasma concentration of tolbutamide
- Antiepileptics: ritonavir possibly increases plasma concentration of ●carbamazepine; ritonavir possibly reduces plasma concentration of lamotrigine; plasma concentration of ritonavir possibly reduced by phenytoin, also plasma concentration of phenytoin possibly affected
- Antifungals: combination of ritonavir with ●itraconazole or ●ketoconazole may increase plasma concentration of either drug (or both); plasma concentration of ritonavir increased by fluconazole; ritonavir reduces plasma concentration of ●voriconazole—avoid concomitant use

  Antihistamines: ritonavir possibly increases plasma concentration of non-sedating antihistamines
- Antimalarials: caution with ritonavir advised by manufacturer of artemether/lumefantrine; ritonavir increases plasma concentration of ●quinine (increased risk of toxicity)

  Antimuscarinics: avoidance of ritonavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when ritonavir given with fesoterodine—consult fesoterodine product literature; ritonavir increases plasma concentration of solifenacin
- Antipsychotics: ritonavir possibly increases plasma concentration of ●antipsychotics; ritonavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); ritonavir increases plasma concentration of ●clozapine (increased risk of toxicity)—avoid concomitant use; ritonavir reduces plasma concentration of olanzapine—consider increasing dose of olanzapine; ritonavir increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: ritonavir increases toxicity of efavirenz, monitor liver function tests; ritonavir increases plasma concentration of indinavir, maraviroc and ●saquinavir; combination of ritonavir with nelfinavir may increase plasma concentration of either drug (or both)
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of ●anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of ●alprazolam, ●diazepam, ●flurazepam and ●zolpidem (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); ritonavir increases plasma concentration of buspirone (increased risk of toxicity)

  Aprepitant: ritonavir possibly increases plasma concentration of aprepitant

  Bosentan: ritonavir possibly increases plasma concentration of bosentan

  Bupropion: ritonavir reduces plasma concentration of bupropion
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of ●calcium-channel blockers; avoidance of ritonavir advised by manufacturer of lercanidipine

  Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin
- Ciclosporin: ritonavir possibly increases plasma concentration of ●ciclosporin
- Colchicine: ritonavir possibly increases risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Ritonavir *(continued)*
- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids, dexamethasone and prednisolone; ritonavir increases plasma concentration of *inhaled* and *intranasal* budesonide and •fluticasone
- Cytotoxics: ritonavir possibly increases plasma concentration of •everolimus and •vinflunine—manufacturer of everolimus and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of •lapatinib, •nilotinib and •pazopanib; ritonavir possibly increases plasma concentration of •docetaxel (increased risk of toxicity); ritonavir increases plasma concentration of paclitaxel; ritonavir possibly increases plasma concentration of vinblastine
- Diuretics: ritonavir increases plasma concentration of •eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with •ergotamine and methysergide—avoid concomitant use
- $5HT_1$ Agonists: ritonavir increases plasma concentration of •eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of •ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with atorvastatin; possible increased risk of myopathy when ritonavir given with •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with •simvastatin (avoid concomitant use)
- Oestrogens: ritonavir accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Ranolazine: ritonavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: ritonavir significantly increases plasma concentration of •sildenafil—avoid concomitant use

  Sympathomimetics: ritonavir possibly increases plasma concentration of dexamfetamine
- Tacrolimus: ritonavir possibly increases plasma concentration of •tacrolimus
- Tadalafil: ritonavir increases plasma concentration of •tadalafil—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of •theophylline (reduced plasma concentration)
- Ulipristal: avoidance of ritonavir advised by manufacturer of •ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of •vardenafil—avoid concomitant use

Rivaroxaban
- Analgesics: increased risk of haemorrhage when anticoagulants given with *intravenous* •diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with •ketorolac (avoid concomitant use, including low-dose heparins)

  Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin
- Antifungals: plasma concentration of rivaroxaban increased by •ketoconazole—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with itraconazole, posaconazole and voriconazole
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of rivaroxaban increased by •ritonavir—manufacturer of rivaroxaban advises avoid concomitant use

Rivastigmine *see* Parasympathomimetics

Rizatriptan *see* $5HT_1$ Agonists

Rocuronium *see* Muscle Relaxants

Roflumilast

Antibacterials: plasma concentration of roflumilast reduced by rifampicin—consider increasing dose of roflumilast

Antidepressants: metabolism of roflumilast inhibited by fluvoxamine

Theophylline: manufacturer of roflumilast advises avoid concomitant use with theophylline

Ulcer-healing Drugs: metabolism of roflumilast inhibited by cimetidine

Ropinirole

Antibacterials: metabolism of ropinirole inhibited by ciprofloxacin (increased plasma concentration)

Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of antipsychotics (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of metoclopramide (antagonism of effect)

Oestrogens: plasma concentration of ropinirole increased by oestrogens

Ropivacaine

Anti-arrhythmics: increased myocardial depression when ropivacaine given with anti-arrhythmics

Antidepressants: metabolism of ropivacaine inhibited by fluvoxamine—avoid prolonged administration of ropivacaine

Rosuvastatin *see* Statins

Rotigotine

Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of antipsychotics (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of metoclopramide (antagonism of effect)

Rufinamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

  Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with carbamazepine; plasma concentration of rufinamide possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly reduced by primidone; plasma concentration of rufinamide possibly increased by valproate (reduce dose of rufinamide)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

  Barbiturates: plasma concentration of rufinamide possibly reduced by phenobarbital, also plasma concentration of phenobarbital possibly increased
- Oestrogens: rufinamide accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat
- Progestogens: rufinamide accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Rupatadine *see* Antihistamines

St John's Wort

Analgesics: St John's wort possibly reduces plasma concentration of methadone

- Anti-arrhythmics: St John's wort possibly reduces plasma concentration of ●dronedarone—avoid concomitant use
- Antibacterials: St John's wort reduces plasma concentration of ●telithromycin (avoid during and for 2 weeks after St John's wort)
- Anticoagulants: St John's wort reduces anticoagulant effect of ●coumarins (avoid concomitant use)
- Antidepressants: possible increased serotonergic effects when St John's wort given with duloxetine or venlafaxine; St John's wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John's wort given with ●SSRIs—avoid concomitant use
- Antiepileptics: avoid concomitant use of St John's wort with ●antiepileptics
- Antifungals: St John's wort reduces plasma concentration of ●voriconazole—avoid concomitant use
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine
- Antipsychotics: St John's wort possibly reduces plasma concentration of ●aripiprazole—increase dose of aripiprazole
- Antivirals: St John's wort reduces plasma concentration of ●atazanavir, ●darunavir, ●efavirenz, ●fosamprenavir, ●indinavir, ●lopinavir, ●nelfinavir, ●nevirapine, ●ritonavir and ●saquinavir—avoid concomitant use; avoidance of St John's wort advised by manufacturer of etravirine; St John's wort possibly reduces plasma concentration of ●maraviroc and ●tipranavir—avoid concomitant use

Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of *oral* midazolam

- Aprepitant: avoidance of St John's wort advised by manufacturer of ●aprepitant

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

- Barbiturates: avoid concomitant use of St John's wort with ●phenobarbital
- Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of amlodipine; St John's wort reduces plasma concentration of nifedipine; St John's wort significantly reduces plasma concentration of ●verapamil
- Cardiac Glycosides: St John's wort reduces plasma concentration of ●digoxin—avoid concomitant use
- Ciclosporin: St John's wort reduces plasma concentration of ●ciclosporin—avoid concomitant use
- Cytotoxics: St John's wort possibly reduces plasma concentration of everolimus and ●vinflunine—manufacturer of everolimus and vinflunine advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of gefitinib and ●lapatinib; St John's wort reduces plasma concentration of ●imatinib—avoid concomitant use; St John's wort accelerates metabolism of ●irinotecan (reduced plasma concentration—avoid concomitant use)
- Diuretics: St John's wort reduces plasma concentration of ●eplerenone—avoid concomitant use
- $5HT_1$ Agonists: increased serotonergic effects when St John's wort given with ●$5HT_1$ agonists—avoid concomitant use

Ivabradine: St John's wort reduces plasma concentration of ivabradine—avoid concomitant use

Lipid-regulating Drugs: St John's wort reduces plasma concentration of simvastatin

- Oestrogens: St John's wort reduces contraceptive effect of ●oestrogens (avoid concomitant use)
- Progestogens: St John's wort reduces contraceptive effect of ●progestogens (avoid concomitant use)
- Tacrolimus: St John's wort reduces plasma concentration of ●tacrolimus—avoid concomitant use
- Theophylline: St John's wort reduces plasma concentration of ●theophylline—avoid concomitant use

St John's Wort *(continued)*

Ulcer-healing Drugs: St John's wort possibly reduces plasma concentration of omeprazole

- Ulipristal: avoidance of St John's wort advised by manufacturer of ●ulipristal (contraceptive effect of ulipristal possibly reduced)

Salbutamol *see* Sympathomimetics, $Beta_2$

Salmeterol *see* Sympathomimetics, $Beta_2$

Saquinavir

- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with ●alfentanil, ●fentanyl or ●methadone—avoid concomitant use
- Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with ●amiodarone, ●disopyramide, ●dronedarone, ●flecainide, ●lidocaine or ●propafenone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when saquinavir given with ●clarithromycin, ●dapsone or ●erythromycin—avoid concomitant use; saquinavir increases plasma concentration of ●rifabutin (also plasma concentration of saquinavir reduced); plasma concentration of saquinavir significantly reduced by ●rifampicin, also risk of hepatotoxicity—avoid concomitant use; avoidance of concomitant saquinavir in severe renal and hepatic impairment advised by manufacturer of ●telithromycin

Anticoagulants: saquinavir possibly enhances anticoagulant effect of warfarin; avoidance of saquinavir advised by manufacturer of rivaroxaban

- Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with ●trazodone or ●tricyclics—avoid concomitant use; plasma concentration of saquinavir reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of saquinavir possibly reduced by carbamazepine, phenytoin and ●primidone

Antifungals: plasma concentration of saquinavir increased by ketoconazole; plasma concentration of saquinavir possibly increased by imidazoles and triazoles

- Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with ●mizolastine—avoid concomitant use
- Antimalarials: caution with saquinavir advised by manufacturer of artemether/lumefantrine; increased risk of ventricular arrhythmias when saquinavir given with ●quinine—avoid concomitant use

Antimuscarinics: avoidance of saquinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when saquinavir given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with ●clozapine, ●haloperidol or ●phenothiazines—avoid concomitant use; saquinavir possibly inhibits metabolism of ●aripiprazole (reduce dose of aripiprazole); saquinavir possibly increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with ●atazanavir or ●lopinavir—avoid concomitant use; saquinavir reduces plasma concentration of darunavir; plasma concentration of saquinavir significantly reduced by efavirenz; plasma concentration of saquinavir increased by indinavir and ●ritonavir; saquinavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); plasma concentration of saquinavir increased by ●nelfinavir—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir reduced by ●tipranavir
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of ●midazolam (risk of pro-

Saquinavir

- Anxiolytics and Hypnotics *(continued)*
  longed sedation—avoid concomitant use of *oral* midazolam)
- Barbiturates: plasma concentration of saquinavir possibly reduced by ●barbiturates
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with ●sotalol—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ●ciclosporin
  Corticosteroids: plasma concentration of saquinavir possibly reduced by dexamethasone
- Cytotoxics: saquinavir possibly increases plasma concentration of ●everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of ●lapatinib and ●pazopanib
  Diuretics: saquinavir increases plasma concentration of eplerenone (reduce dose of eplerenone)
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with ●ergotamine and methysergide—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with atorvastatin; possible increased risk of myopathy when saquinavir given with ●rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with ●simvastatin (avoid concomitant use)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when saquinavir given with ●pentamidine isetionate—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with ●sildenafil—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of ●tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with ●tadalafil—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by cimetidine; plasma concentration of saquinavir possibly increased by ●esomeprazole, ●lansoprazole, ●pantoprazole and ●rabeprazole—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by ●omeprazole—manufacturer of saquinavir advises avoid concomitant use
- Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with ●vardenafil—avoid concomitant use

Saxagliptin *see* Antidiabetics

Secobarbital *see* Barbiturates

Selegiline

Note Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ●pethidine (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with opioid analgesics
- Antidepressants: manufacturer of selegiline advises avoid concomitant use with citalopram and escitalopram; increased risk of hypertension and CNS excitation when selegiline given with ●fluoxetine (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●fluvoxamine, ●sertraline or ●venlafaxine (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●paroxetine (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with ●MAOIs—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with ●moclobemide; CNS toxicity reported when selegiline given with ●tricyclics
  Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of entacapone if used concomitantly; selegiline enhances effects and increases toxicity of levodopa (reduce dose of levodopa)
  $5HT_1$ Agonists: manufacturer of selegiline advises avoid concomitant use with $5HT_1$ agonists
  Memantine: effects of dopaminergics and selegiline possibly enhanced by memantine
  Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Oestrogens: plasma concentration of selegiline increased by ●oestrogens—manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by ●progestogens—manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: risk of hypertensive crisis when selegiline given with ●dopamine

Selenium

Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)

Sertraline *see* Antidepressants, SSRI

Sevelamer

Antibacterials: sevelamer reduces bioavailability of ciprofloxacin
Ciclosporin: sevelamer possibly reduces plasma concentration of ciclosporin
Mycophenolate: sevelamer possibly reduces plasma concentration of mycophenolate
Tacrolimus: sevelamer possibly reduces plasma concentration of tacrolimus
Thyroid Hormones: sevelamer possibly reduces absorption of levothyroxine

Sevoflurane *see* Anaesthetics, General

Sildenafil

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with ●alpha-blockers (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 515
  Antibacterials: plasma concentration of sildenafil possibly increased by clarithromycin and telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by erythromycin—reduce initial dose of sildenafil
  Antifungals: plasma concentration of sildenafil increased by itraconazole and ketoconazole—reduce initial dose of sildenafil
- Antivirals: side-effects of sildenafil possibly increased by ●atazanavir; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil increased by ●indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by nelfinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ●ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with ●saquinavir—avoid concomitant use
  Bosentan: plasma concentration of sildenafil reduced by bosentan
  Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amlodipine
  Grapefruit Juice: plasma concentration of sildenafil possibly increased by grapefruit juice

Sildenafil *(continued)*
- Nicorandil: sildenafil significantly enhances hypotensive effect of •nicorandil (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of •nitrates (avoid concomitant use)

Ulcer-healing Drugs: plasma concentration of sildenafil increased by cimetidine (consider reducing dose of sildenafil)

Simvastatin *see* Statins

Sirolimus

Anti-arrhythmics: caution with sirolimus advised by manufacturer of dronedarone
- Antibacterials: plasma concentration of sirolimus increased by •clarithromycin and •telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with •erythromycin; plasma concentration of sirolimus reduced by •rifabutin and •rifampicin—avoid concomitant use
- Antifungals: plasma concentration of sirolimus increased by •itraconazole, •ketoconazole and •voriconazole—avoid concomitant use; plasma concentration of sirolimus increased by micafungin and •miconazole; plasma concentration of sirolimus possibly increased by posaconazole
- Antivirals: plasma concentration of sirolimus possibly increased by •atazanavir and lopinavir
- Calcium-channel Blockers: plasma concentration of sirolimus increased by •diltiazem; plasma concentration of both drugs increased when sirolimus given with •verapamil

Ciclosporin: plasma concentration of sirolimus increased by ciclosporin
- Grapefruit Juice: plasma concentration of sirolimus increased by •grapefruit juice—avoid concomitant use

Sitagliptin *see* Antidiabetics

Sitaxentan
- Anticoagulants: sitaxentan enhances anticoagulant effect of •coumarins
- Ciclosporin: plasma concentration of sitaxentan increased by •ciclosporin—avoid concomitant use

Oestrogens: sitaxentan increases plasma concentration of oestrogens

Progestogens: sitaxentan increases plasma concentration of progestogens

Sodium Aurothiomalate
- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with •ACE inhibitors

Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of penicillamine (increased risk of toxicity)

Sodium Benzoate

Antiepileptics: effects of sodium benzoate possibly reduced by valproate

Antipsychotics: effects of sodium benzoate possibly reduced by haloperidol

Corticosteroids: effects of sodium benzoate possibly reduced by corticosteroids

Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by probenecid

Sodium Bicarbonate *see* Antacids

Sodium Citrate

Antibacterials: avoid concomitant use of sodium citrate with methenamine

Sodium Clodronate *see* Bisphosphonates

Sodium Nitroprusside *see* Vasodilator Antihypertensives

Sodium Oxybate
- Analgesics: effects of sodium oxybate enhanced by •opioid analgesics (avoid concomitant use)

Antidepressants: increased risk of side-effects when sodium oxybate given with tricyclics

Antipsychotics: effects of sodium oxybate possibly enhanced by antipsychotics

Sodium Oxybate *(continued)*
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by •benzodiazepines (avoid concomitant use)
- Barbiturates: effects of sodium oxybate enhanced by •barbiturates (avoid concomitant use)

Sodium Phenylbutyrate

Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate

Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol

Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids

Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probenecid

Sodium Valproate *see* Valproate

Solifenacin *see* Antimuscarinics

Somatropin

Corticosteroids: growth-promoting effect of somatropin may be inhibited by corticosteroids

Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy)

Sorafenib

Antibacterials: bioavailability of sorafenib reduced by neomycin; plasma concentration of sorafenib reduced by rifampicin
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of •coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel

Sotalol *see* Beta-blockers

Spironolactone *see* Diuretics

Statins

Antacids: absorption of rosuvastatin reduced by antacids
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with •amiodarone or •dronedarone
- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by •clarithromycin; increased risk of myopathy when simvastatin given with •clarithromycin, •erythromycin or •telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by erythromycin; possible increased risk of myopathy when atorvastatin given with erythromycin or fusidic acid; plasma concentration of pravastatin increased by erythromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by rifampicin; metabolism of fluvastatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with •daptomycin (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with •fusidic acid; possible increased risk of myopathy when pravastatin given with telithromycin; increased risk of myopathy when atorvastatin given with •telithromycin (avoid concomitant use)
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; fluvastatin and simvastatin enhance anticoagulant effect of •coumarins; rosuvastatin possibly enhances anticoagulant effect of •coumarins and •phenindione

Antidepressants: plasma concentration of simvastatin reduced by St John's wort

Antidiabetics: fluvastatin possibly increases plasma concentration of glibenclamide
- Antiepileptics: plasma concentration of simvastatin reduced by •carbamazepine—consider increasing dose of simvastatin; combination of fluvastatin with

Statins

- Antiepileptics *(continued)*
  phenytoin may increase plasma concentration of either drug (or both)
- Antifungals: increased risk of myopathy when simvastatin given with •itraconazole, •ketoconazole or •posaconazole (avoid concomitant use); possible increased risk of myopathy when simvastatin given with •miconazole—avoid concomitant use; plasma concentration of fluvastatin increased by fluconazole; increased risk of myopathy when atorvastatin given with •itraconazole or •posaconazole (avoid concomitant use); possible increased risk of myopathy when atorvastatin or simvastatin given with imidazoles; possible increased risk of myopathy when atorvastatin or simvastatin given with triazoles
- Antivirals: possible increased risk of myopathy when rosuvastatin given with •atazanavir, •darunavir, •fosamprenavir, •indinavir, •lopinavir, •nelfinavir, •ritonavir and •saquinavir—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when simvastatin given with •atazanavir, •indinavir, •nelfinavir, •ritonavir or •saquinavir (avoid concomitant use); possible increased risk of myopathy when atorvastatin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir or saquinavir; plasma concentration of pravastatin possibly increased by darunavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by efavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when simvastatin given with •fosamprenavir or •lopinavir—avoid concomitant use; plasma concentration of simvastatin possibly increased by •tipranavir—avoid concomitant use; plasma concentration of atorvastatin possibly increased by •tipranavir (consider reducing dose of atorvastatin); plasma concentration of rosuvastatin possibly increased by •tipranavir—manufacturer of rosuvastatin advises avoid concomitant use

  Bosentan: plasma concentration of simvastatin reduced by bosentan
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with amlodipine; plasma concentration of atorvastatin and simvastatin increased by diltiazem—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with •verapamil

  Cardiac Glycosides: atorvastatin possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of myopathy when statins given with •ciclosporin; increased risk of myopathy when rosuvastatin given with •ciclosporin (avoid concomitant use)
- Colchicine: possible increased risk of myopathy when statins given with •colchicine

  Cytotoxics: plasma concentration of simvastatin possibly increased by dasatinib; plasma concentration of simvastatin increased by imatinib
- Eltrombopag: plasma concentration of rosuvastatin increased by •eltrombopag (consider reducing dose of rosuvastatin)
- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by •grapefruit juice—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with •danazol
- Lipid-regulating Drugs: increased risk of myopathy when statins given with •gemfibrozil (preferably avoid concomitant use); increased risk of myopathy when statins given with •fibrates; increased risk of myopathy when statins given with •nicotinic acid (applies to lipid regulating doses of nicotinic acid)

  Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ethinylestradiol

Statins *(continued)*

Progestogens: atorvastatin increases plasma concentration of norethisterone; rosuvastatin increases plasma concentration of norgestrel

Ranolazine: plasma concentration of simvastatin increased by ranolazine (consider reducing dose of simvastatin)

Retinoids: plasma concentration of simvastatin reduced by alitretinoin

Stavudine

- Antivirals: increased risk of side-effects when stavudine given with •didanosine; increased risk of toxicity when stavudine given with •ribavirin; effects of stavudine possibly inhibited by •zidovudine (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin; increased risk of toxicity when stavudine given with •hydroxycarbamide—avoid concomitant use

Stiripentol

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antiepileptics: stiripentol increases plasma concentration of •carbamazepine and •phenytoin
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

  Anxiolytics and Hypnotics: stiripentol increases plasma concentration of clobazam
- Barbiturates: stiripentol increases plasma concentration of •phenobarbital
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Streptomycin *see* Aminoglycosides

Strontium Ranelate

Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

Antibacterials: sucralfate reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin, ofloxacin and tetracyclines

- Anticoagulants: sucralfate possibly reduces absorption of •coumarins (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of •phenytoin

Antifungals: sucralfate reduces absorption of ketoconazole

Antipsychotics: sucralfate reduces absorption of sulpiride

Cardiac Glycosides: sucralfate possibly reduces absorption of cardiac glycosides

Theophylline: sucralfate possibly reduces absorption of theophylline (give at least 2 hours apart)

Thyroid Hormones: sucralfate reduces absorption of levothyroxine

Ulcer-healing Drugs: sucralfate possibly reduces absorption of lansoprazole

Sugammadex

Antibacterials: response to sugammadex possibly reduced by fusidic acid

Hormone Antagonists: response to sugammadex possibly reduced by toremifene

Oestrogens: sugammadex possibly reduces plasma concentration of oestrogens

Progestogens: sugammadex possibly reduces plasma concentration of progestogens

Sulfadiazine *see* Sulfonamides

Sulfadoxine *see* Sulfonamides

Sulfamethoxazole *see* Sulfonamides

Sulfasalazine *see* Aminosalicylates

Sulfinpyrazone

Analgesics: effects of sulfinpyrazone antagonised by aspirin

Antibacterials: sulfinpyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfinpyrazone reduces excretion of penicillins; effects of sulfinpyrazone antagonised by pyrazinamide

- Anticoagulants: sulfinpyrazone enhances anticoagulant effect of ●coumarins
- Antidiabetics: sulfinpyrazone enhances effects of ●sulfonylureas
- Antiepileptics: sulfinpyrazone increases plasma concentration of ●phenytoin
- Ciclosporin: sulfinpyrazone reduces plasma concentration of ●ciclosporin

Theophylline: sulfinpyrazone reduces plasma concentration of theophylline

Sulfonamides

Anaesthetics, General: sulfonamides enhance effects of thiopental

Anaesthetics, Local: increased risk of methaemoglobinaemia when sulfonamides given with prilocaine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with ●amiodarone—avoid concomitant use of co-trimoxazole
- Antibacterials: increased risk of crystalluria when sulfonamides given with ●methenamine
- Anticoagulants: sulfonamides enhance anticoagulant effect of ●coumarins; sulfonamides possibly inhibit metabolism of phenindione

Antidiabetics: sulfonamides rarely enhance the effects of sulfonylureas

Antiepileptics: sulfonamides possibly increase plasma concentration of phenytoin

- Antimalarials: increased antifolate effect when sulfonamides given with ●pyrimethamine
- Antipsychotics: avoid concomitant use of sulfonamides with ●clozapine (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●azathioprine
- Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with ●ciclosporin; sulfadiazine possibly reduces plasma concentration of ●ciclosporin
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●mercaptopurine or ●methotrexate; sulfonamides increase risk of methotrexate toxicity

Potassium Aminobenzoate: effects of sulfonamides inhibited by potassium aminobenzoate

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Sulfonylureas *see* Antidiabetics

Sulindac *see* NSAIDs

Sulpiride *see* Antipsychotics

Sumatriptan *see* $5HT_1$ Agonists

Sunitinib

Antibacterials: metabolism of sunitinib accelerated by rifampicin (reduced plasma concentration)

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antifungals: metabolism of sunitinib inhibited by ketoconazole (increased plasma concentration)

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Suxamethonium *see* Muscle Relaxants

Sympathomimetics

- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ●adrenergic neurone blockers; dexamfetamine antagonises hypotensive effect of ●guanethidine

Alcohol: effects of methylphenidate possibly enhanced by alcohol

- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ●tolazoline
- Anaesthetics, General: increased risk of hypertension when methylphenidate given with ●volatile liquid general anaesthetics; increased risk of arrhythmias when adrenaline (epinephrine) given with ●volatile liquid general anaesthetics
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of ●coumarins
- Antidepressants: risk of hypertensive crisis when methylphenidate given with ●MAOIs, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with ●MAOIs or ●moclobemide; methylphenidate possibly inhibits metabolism of SSRIs and tricyclics; increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) given with ●tricyclics; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with ●tricyclics (but local anaesthetics with adrenaline appear to be safe)

Antiepileptics: methylphenidate increases plasma concentration of phenytoin; methylphenidate possibly increases plasma concentration of primidone

Antipsychotics: hypertensive effect of sympathomimetics antagonised by antipsychotics; dexamfetamine possibly antagonises antipsychotic effects of chlorpromazine; methylphenidate possibly increases side-effects of risperidone

Antivirals: plasma concentration of dexamfetamine possibly increased by ritonavir

Barbiturates: methylphenidate possibly increases plasma concentration of phenobarbital

- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective ●beta-blockers, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective ●beta-blockers; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective ●beta-blockers
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with clonidine; serious adverse events reported with concomitant use of methylphenidate and ●clonidine (causality not established)

Corticosteroids: ephedrine accelerates metabolism of dexamethasone

- Dopaminergics: risk of toxicity when isometheptene given with ●bromocriptine; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by entacapone; avoid concomitant use of sympathomimetics with ●rasagiline; risk of hypertensive crisis when dopamine given with ●selegiline

Doxapram: increased risk of hypertension when sympathomimetics given with doxapram

Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ergotamine and methysergide

Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with oxytocin (due to enhanced vasopressor effect)

- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by ●dopexamine; dopexamine possibly enhances effects of ●noradrenaline (norepinephrine)

Theophylline: avoidance of ephedrine in children advised by manufacturer of theophylline

Sympathomimetics, Beta$_2$

Antifungals: metabolism of salmeterol inhibited by ketoconazole (increased plasma concentration)

Atomoxetine: Increased risk of cardiovascular side-effects when *parenteral* salbutamol given with atomoxetine

Cardiac Glycosides: salbutamol possibly reduces plasma concentration of digoxin

Corticosteroids: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with corticosteroids—see Hypokalaemia, p. 176

Diuretics: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with acetazolamide, loop diuretics or thiazides and related diuretics—see Hypokalaemia, p. 176

- Methyldopa: acute hypotension reported when *infusion* of salbutamol given with ●methyldopa

Muscle Relaxants: bambuterol enhances effects of suxamethonium

Theophylline: increased risk of hypokalaemia when high doses of beta$_2$ sympathomimetics given with theophylline—see Hypokalaemia, p. 176

Tacrolimus

Note Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with alcohol consumption (p. 722) does not apply to tacrolimus taken systemically

- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with NSAIDs; increased risk of nephrotoxicity when tacrolimus given with ●ibuprofen

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with angiotensin-II receptor antagonists

Anti-arrhythmics: caution with tacrolimus advised by manufacturer of dronedarone

- Antibacterials: plasma concentration of tacrolimus increased by ●clarithromycin and ●erythromycin; plasma concentration of tacrolimus possibly reduced by rifabutin; plasma concentration of tacrolimus reduced by ●rifampicin; increased risk of nephrotoxicity when tacrolimus given with ●aminoglycosides; plasma concentration of tacrolimus possibly increased by ●chloramphenicol and ●telithromycin; possible increased risk of nephrotoxicity when tacrolimus given with vancomycin
- Antidepressants: plasma concentration of tacrolimus reduced by ●St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of tacrolimus reduced by phenytoin, also plasma concentration of phenytoin possibly increased

- Antifungals: plasma concentration of tacrolimus increased by ●fluconazole, ●itraconazole, ●ketoconazole, ●posaconazole and ●voriconazole (consider reducing dose of tacrolimus); increased risk of nephrotoxicity when tacrolimus given with ●amphotericin; plasma concentration of tacrolimus reduced by ●caspofungin; plasma concentration of tacrolimus possibly increased by ●imidazoles
- Antipsychotics: avoidance of tacrolimus advised by manufacturer of ●droperidol (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with aciclovir or ganciclovir; plasma concentration of tacrolimus possibly increased by ●atazanavir, ●nelfinavir and ●ritonavir; plasma concentration of tacrolimus possibly affected by ●efavirenz; plasma concentration of tacrolimus increased by ●fosamprenavir; plasma concentration of tacrolimus increased by ●saquinavir (consider reducing dose of tacrolimus)
- Barbiturates: plasma concentration of tacrolimus reduced by ●phenobarbital
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by felodipine, nicardipine and verapamil; plasma concentration of tacrolimus increased by ●diltiazem and ●nifedipine

Tacrolimus *(continued)*

- Ciclosporin: tacrolimus increases plasma concentration of ●ciclosporin (increased risk of nephrotoxicity)—avoid concomitant use
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with ●potassium-sparing diuretics and aldosterone antagonists
- Grapefruit Juice: plasma concentration of tacrolimus increased by ●grapefruit juice

Hormone Antagonists: plasma concentration of tacrolimus possibly increased by danazol

Mifamurtide: avoidance of tacrolimus advised by manufacturer of mifamurtide

Oestrogens: plasma concentration of tacrolimus possibly increased by ethinylestradiol

- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with ●potassium salts

Sevelamer: plasma concentration of tacrolimus possibly reduced by sevelamer

Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by omeprazole

Tadalafil

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with ●doxazosin—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with ●alpha-blockers—see also p. 515
- Antibacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by ●rifampicin—manufacturer of tadalafil advises avoid concomitant use
- Antifungals: plasma concentration of tadalafil increased by ●ketoconazole—manufacturer of tadalafil advises avoid concomitant use; plasma concentration of tadalafil possibly increased by itraconazole
- Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ●ritonavir—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with ●saquinavir—avoid concomitant use

Bosentan: plasma concentration of tadalafil reduced by bosentan

Grapefruit Juice: plasma concentration of tadalafil possibly increased by grapefruit juice

- Nicorandil: tadalafil significantly enhances hypotensive effect of ●nicorandil (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of ●nitrates (avoid concomitant use)

Tamoxifen

Antibacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration)

- Anticoagulants: tamoxifen enhances anticoagulant effect of ●coumarins
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by ●fluoxetine and ●paroxetine (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of ●droperidol (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by ●bupropion (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by ●cinacalcet (avoid concomitant use)

Tamsulosin *see* Alpha-blockers

Taxanes *see* Docetaxel and Paclitaxel

Tegafur with uracil *see* Fluorouracil

Teicoplanin

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Telbivudine

- Interferons: increased risk of peripheral neuropathy when telbivudine given with ●interferon alfa

Telithromycin

Analgesics: telithromycin inhibits the metabolism of oxycodone

- Anti-arrhythmics: avoidance of telithromycin advised by manufacturer of ●dronedarone (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of telithromycin reduced by ●rifampicin (avoid during and for 2 weeks after rifampicin)
- Antidepressants: plasma concentration of telithromycin reduced by ●St John's wort (avoid during and for 2 weeks after St John's wort)
- Antiepileptics: plasma concentration of telithromycin reduced by ●carbamazepine, ●phenytoin and ●primidone (avoid during and for 2 weeks after carbamazepine, phenytoin and primidone)
- Antifungals: manufacturer of telithromycin advises avoid concomitant use with ●ketoconazole in severe renal and hepatic impairment

Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: increased risk of ventricular arrhythmias when telithromycin given with ●pimozide—avoid concomitant use
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ●atazanavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●nelfinavir, ●ritonavir, ●saquinavir and ●tipranavir in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc)
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of ●midazolam (increased plasma concentration with increased sedation)

Aprepitant: telithromycin possibly increases plasma concentration of aprepitant

- Barbiturates: plasma concentration of telithromycin reduced by ●phenobarbital (avoid during and for 2 weeks after phenobarbital)

Cardiac Glycosides: telithromycin possibly increases plasma concentration of digoxin

- Ciclosporin: telithromycin possibly increases plasma concentration of ●ciclosporin
- Colchicine: telithromycin possibly increases risk of ●colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of ●everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of ●lapatinib, ●nilotinib and ●pazopanib
- Diuretics: telithromycin increases plasma concentration of ●eplerenone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with ●ergotamine and methysergide—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of ●ivabradine—avoid concomitant use
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ●atorvastatin or ●simvastatin (avoid concomitant use); possible increased risk of myopathy when telithromycin given with pravastatin
- Ranolazine: telithromycin possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil

- Sirolimus: telithromycin increases plasma concentration of ●sirolimus—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of ●tacrolimus

Telithromycin *(continued)*

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Telmisartan *see* Angiotensin-II Receptor Antagonists

Temazepam *see* Anxiolytics and Hypnotics

Temocillin *see* Penicillins

Temoporfin

- Cytotoxics: increased skin photosensitivity when temoporfin given with *topical* ●fluorouracil

Temozolomide

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of temozolomide increased by valproate

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Temsirolimus

Note The main active metabolite of temsirolimus is sirolimus—*see also* interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by ●rifampicin—avoid concomitant use

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

- Antifungals: plasma concentration of active metabolite of temsirolimus increased by ●ketoconazole—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tenofovir

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with adefovir; tenofovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with ●cidofovir; tenofovir increases plasma concentration of ●didanosine (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by lopinavir

Tenoxicam *see* NSAIDs

Terazosin *see* Alpha-blockers

Terbinafine

- Antibacterials: plasma concentration of terbinafine reduced by ●rifampicin

Antidepressants: terbinafine possibly increases plasma concentration of tricyclics

Ciclosporin: terbinafine possibly reduces plasma concentration of ciclosporin

Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with oestrogens (when used for contraception)

Progestogens: occasional reports of breakthrough bleeding when terbinafine given with progestogens (when used for contraception)

Ulcer-healing Drugs: plasma concentration of terbinafine increased by cimetidine

Terbutaline *see* Sympathomimetics, Beta$_2$

Testolactone

- Anticoagulants: testolactone enhances anticoagulant effect of ●coumarins and ●phenindione

Testosterone

- Anticoagulants: testosterone enhances anticoagulant effect of ●coumarins and ●phenindione

Antidiabetics: testosterone possibly enhances hypoglycaemic effect of antidiabetics

Tetrabenazine

- Antidepressants: risk of CNS excitation and hypertension when tetrabenazine given with ●MAOIs

Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with antipsychotics

Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with amantadine

Tetrabenazine *(continued)*
Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide

Tetracosactide *see* Corticosteroids

Tetracycline *see* Tetracyclines

Tetracyclines
ACE Inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate)
Adsorbents: absorption of tetracyclines possibly reduced by kaolin
Antacids: absorption of tetracyclines reduced by antacids
Antibacterials: plasma concentration of doxycycline reduced by rifampicin—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of penicillins
- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of ●coumarins and ●phenindione

Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of sulfonylureas
Antiepileptics: metabolism of doxycycline accelerated by carbamazepine (reduced effect); metabolism of doxycycline accelerated by phenytoin and primidone (reduced plasma concentration)
Atovaquone: tetracycline reduces plasma concentration of atovaquone
Barbiturates: metabolism of doxycycline accelerated by barbiturates (reduced plasma concentration)
Calcium Salts: absorption of tetracycline reduced by calcium salts
- Ciclosporin: doxycycline possibly increases plasma concentration of ●ciclosporin

Cytotoxics: doxycycline or tetracycline increase risk of methotrexate toxicity
Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products
Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics
Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine and methysergide
Iron: absorption of tetracyclines reduced by *oral* iron, also absorption of *oral* iron reduced by tetracyclines
Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine
- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with ●retinoids (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)
Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitratobismuthate
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767
Zinc: absorption of tetracyclines reduced by zinc, also absorption of zinc reduced by tetracyclines

Theophylline
Allopurinol: plasma concentration of theophylline possibly increased by allopurinol
Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine; increased risk of arrhythmias when theophylline given with halothane
Anti-arrhythmics: theophylline antagonises antiarrhythmic effect of adenosine; plasma concentration of theophylline increased by propafenone
- Antibacterials: plasma concentration of theophylline possibly increased by azithromycin and isoniazid; metabolism of theophylline inhibited by ●clarithromycin (increased plasma concentration); metabolism of theophylline inhibited by ●erythromycin (increased plasma concentration), if erythromycin given *by mouth*, also decreased

Theophylline
- Antibacterials *(continued)*
plasma-erythromycin concentration; plasma concentration of theophylline increased by ●ciprofloxacin and ●norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with ●quinolones
- Antidepressants: plasma concentration of theophylline increased by ●fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline reduced by ●St John's wort—avoid concomitant use
- Antiepileptics: metabolism of theophylline accelerated by carbamazepine and primidone (reduced effect); plasma concentration of both drugs reduced when theophylline given with ●phenytoin
- Antifungals: plasma concentration of theophylline possibly increased by ●fluconazole and ●ketoconazole
- Antivirals: plasma concentration of theophylline possibly increased by aciclovir; metabolism of theophylline accelerated by ●ritonavir (reduced plasma concentration)

Anxiolytics and Hypnotics: theophylline possibly reduces effects of benzodiazepines
Barbiturates: metabolism of theophylline accelerated by barbiturates (reduced effect)
- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by ●calcium-channel blockers (enhanced effect); plasma concentration of theophylline increased by diltiazem; plasma concentration of theophylline increased by ●verapamil (enhanced effect)

Corticosteroids: increased risk of hypokalaemia when theophylline given with corticosteroids
Cytotoxics: plasma concentration of theophylline possibly increased by methotrexate
Disulfiram: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity)
Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazides and related diuretics
Doxapram: increased CNS stimulation when theophylline given with doxapram
- Febuxostat: caution with theophylline advised by manufacturer of ●febuxostat
- Interferons: metabolism of theophylline inhibited by ●interferon alfa (consider reducing dose of theophylline)

Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced
Lithium: theophylline increases excretion of lithium (reduced plasma concentration)
Oestrogens: excretion of theophylline reduced by oestrogens (increased plasma concentration)
Pentoxifylline: plasma concentration of theophylline increased by pentoxifylline
Roflumilast: avoidance of theophylline advised by manufacturer of roflumilast
Sulfinpyrazone: plasma concentration of theophylline reduced by sulfinpyrazone
Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with ephedrine in children
Sympathomimetics, Beta$_2$: increased risk of hypokalaemia when theophylline given with high doses of beta$_2$ sympathomimetics—see Hypokalaemia, p. 176
- Ulcer-healing Drugs: metabolism of theophylline inhibited by ●cimetidine (increased plasma concentration); absorption of theophylline possibly reduced by sucralfate (give at least 2 hours apart)

Theophylline *(continued)*
Vaccines: plasma concentration of theophylline possibly increased by influenza vaccine

Thiazolidinediones *see* Antidiabetics

Thiopental *see* Anaesthetics, General

Thiotepa
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Muscle Relaxants: thiotepa enhances effects of suxamethonium

Thioxanthenes *see* Antipsychotics

Thyroid Hormones
Antacids: absorption of levothyroxine possibly reduced by antacids
Anti-arrhythmics: for concomitant use of thyroid hormones and amiodarone see p. 94
Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)
• Anticoagulants: thyroid hormones enhance anticoagulant effect of •coumarins and •phenindione
Antidepressants: thyroid hormones enhance effects of amitriptyline and imipramine; thyroid hormones possibly enhance effects of tricyclics
Antiepileptics: metabolism of thyroid hormones accelerated by carbamazepine and primidone (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by phenytoin (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
Barbiturates: metabolism of thyroid hormones accelerated by barbiturates (may increase requirements for thyroid hormones in hypothyroidism)
Beta-blockers: levothyroxine accelerates metabolism of propranolol
Calcium Salts: absorption of levothyroxine reduced by calcium salts
Cytotoxics: plasma concentration of levothyroxine possibly reduced by imatinib
Iron: absorption of levothyroxine reduced by *oral* iron (give at least 2 hours apart)
Lanthanum: absorption of levothyroxine reduced by lanthanum (give at least 2 hours apart)
Lipid-regulating Drugs: absorption of levothyroxine reduced by colesevelam; absorption of thyroid hormones reduced by colestipol and colestyramine
Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by oestrogens
Orlistat: possible increased risk of hypothyroidism when levothyroxine given with orlistat
Polystyrene Sulphonate Resins: absorption of levothyroxine reduced by polystyrene sulphonate resins
Sevelamer: absorption of levothyroxine possibly reduced by sevelamer
Ulcer-healing Drugs: absorption of levothyroxine reduced by cimetidine and sucralfate

Tiagabine
• Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
Antiepileptics: plasma concentration of tiagabine reduced by carbamazepine, phenytoin and primidone
• Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

Tiagabine *(continued)*
Barbiturates: plasma concentration of tiagabine reduced by phenobarbital
• Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Tiaprofenic Acid *see* NSAIDs

Tibolone
Antibacterials: metabolism of tibolone accelerated by rifampicin (reduced plasma concentration)
Antiepileptics: metabolism of tibolone accelerated by carbamazepine and primidone (reduced plasma concentration); metabolism of tibolone accelerated by phenytoin
Barbiturates: metabolism of tibolone accelerated by barbiturates (reduced plasma concentration)

Ticarcillin *see* Penicillins

Tigecycline
Anticoagulants: tigecycline possibly enhances anticoagulant effect of coumarins
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Tiludronic Acid *see* Bisphosphonates

Timolol *see* Beta-blockers

Tinidazole
Alcohol: possibility of disulfiram-like reaction when tinidazole given with alcohol
Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Tinzaparin *see* Heparins

Tioguanine
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
• Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: increased risk of hepatotoxicity when tioguanine given with busulfan

Tiotropium *see* Antimuscarinics

Tipranavir
Analgesics: plasma concentration of tipranavir possibly reduced by buprenorphine
Antacids: absorption of tipranavir reduced by antacids
• Antibacterials: tipranavir increases plasma concentration of •clarithromycin (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of •rifabutin (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by •rifampicin—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of •telithromycin
Anticoagulants: avoidance of tipranavir advised by manufacturer of rivaroxaban
• Antidepressants: plasma concentration of tipranavir possibly reduced by •St John's wort—avoid concomitant use
Antiepileptics: plasma concentration of tipranavir possibly reduced by carbamazepine
Antifungals: plasma concentration of tipranavir increased by fluconazole
• Antimalarials: caution with tipranavir advised by manufacturer of artemether/lumefantrine; tipranavir possibly increases plasma concentration of •quinine (increased risk of toxicity)
Antimuscarinics: avoidance of tipranavir advised by manufacturer of darifenacin
• Antivirals: tipranavir reduces plasma concentration of •abacavir, •didanosine, •fosamprenavir, •lopinavir, •saquinavir and •zidovudine; plasma concentration of tipranavir increased by atazanavir (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of •etravirine, also plasma concentration of tipranavir increased (avoid concomitant use)

Tipranavir *(continued)*
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with •metoprolol for heart failure
- Lipid-regulating Drugs: tipranavir possibly increases plasma concentration of •atorvastatin (consider reducing dose of atorvastatin); tipranavir possibly increases plasma concentration of •rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; tipranavir possibly increases plasma concentration of •simvastatin—avoid concomitant use
- Ranolazine: tipranavir possibly increases plasma concentration of •ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of •esomeprazole and •omeprazole

Vitamins: increased risk of bleeding when tipranavir given with high doses of vitamin E

Tirofiban

Iloprost: increased risk of bleeding when tirofiban given with iloprost

Tizanidine *see* Muscle Relaxants

Tobramycin *see* Aminoglycosides

Tocilizumab
- Vaccines: avoid concomitant use of tocilizumab with live •vaccines (see p. 746)

Tolazoline *see* Alpha-blockers

Tolbutamide *see* Antidiabetics

Tolcapone

Antidepressants: avoid concomitant use of tolcapone with MAOIs

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Tolfenamic Acid *see* NSAIDs

Tolterodine *see* Antimuscarinics

Tolvaptan

Antibacterials: plasma concentration of tolvaptan reduced by rifampicin

Antifungals: plasma concentration of tolvaptan increased by ketoconazole

Cardiac Glycosides: tolvaptan increases plasma concentration of digoxin (increased risk of toxicity)
- Grapefruit Juice: plasma concentration of tolvaptan increased by •grapefruit juice—avoid concomitant use

Topiramate
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

Antidiabetics: topiramate possibly increases plasma concentration of metformin; topiramate possibly reduces plasma concentration of glibenclamide
- Antiepileptics: plasma concentration of topiramate often reduced by carbamazepine; topiramate increases plasma concentration of •phenytoin (also plasma concentration of topiramate reduced); CNS toxicity reported when topiramate given with valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

Diuretics: plasma concentration of topiramate possibly increased by hydrochlorothiazide

Lithium: topiramate possibly affects plasma concentration of lithium
- Oestrogens: topiramate accelerates metabolism of •oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Topiramate *(continued)*
- Progestogens: topiramate accelerates metabolism of •progestogens (reduced contraceptive effect—see p. 495)

Torasemide *see* Diuretics

Toremifene
- Anticoagulants: toremifene possibly enhances anticoagulant effect of •coumarins

Antiepileptics: metabolism of toremifene possibly accelerated by carbamazepine (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenytoin; metabolism of toremifene accelerated by primidone (reduced plasma concentration)

Barbiturates: metabolism of toremifene possibly accelerated by barbiturates (reduced plasma concentration)

Diuretics: increased risk of hypercalcaemia when toremifene given with thiazides and related diuretics

Sugammadex: toremifene possibly reduces response to sugammadex

Trabectedin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tramadol *see* Opioid Analgesics

Trandolapril *see* ACE Inhibitors

Tranylcypromine *see* MAOIs

Trazodone *see* Antidepressants, Tricyclic (related)

Tretinoin *see* Retinoids

Triamcinolone *see* Corticosteroids

Triamterene *see* Diuretics

Triclofos *see* Anxiolytics and Hypnotics

Trientine

Iron: trientine reduces absorption of *oral* iron

Zinc: trientine reduces absorption of zinc, also absorption of trientine reduced by zinc

Trifluoperazine *see* Antipsychotics

Trihexyphenidyl *see* Antimuscarinics

Trilostane

Diuretics: increased risk of hyperkalaemia when trilostane given with potassium-sparing diuretics and aldosterone antagonists

Trimethoprim

ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with ACE inhibitors

Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with angiotensin-II receptor antagonists
- Anti-arrhythmics: increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with •amiodarone—avoid concomitant use of co-trimoxazole

Antibacterials: plasma concentration of trimethoprim possibly reduced by rifampicin; plasma concentration of both drugs may increase when trimethoprim given with dapsone

Anticoagulants: trimethoprim possibly enhances anticoagulant effect of coumarins

Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulfonylureas
- Antiepileptics: trimethoprim increases plasma concentration of •phenytoin (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with •pyrimethamine

Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of lamivudine—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with •azathioprine

Trimethoprim *(continued)*

Cardiac Glycosides: trimethoprim possibly increases plasma concentration of digoxin

- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with •ciclosporin, also plasma concentration of ciclosporin reduced by *intravenous* trimethoprim
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with •mercaptopurine or •methotrexate

Diuretics: increased risk of hyperkalaemia when trimethoprim given with eplerenone

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Trimipramine *see* Antidepressants, Tricyclic

Tripotassium Dicitratobismuthate

Antibacterials: tripotassium dicitratobismuthate reduces absorption of tetracyclines

Tropicamide *see* Antimuscarinics

Trospium *see* Antimuscarinics

Tryptophan

- Antidepressants: CNS toxicity reported when tryptophan given with fluoxetine; possible increased serotonergic effects when tryptophan given with duloxetine; CNS excitation and confusion when tryptophan given with •MAOIs (reduce dose of tryptophan); agitation and nausea may occur when tryptophan given with •SSRIs
- Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether/lumefantrine

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

Typhoid Vaccine (oral) *see* Vaccines

Typhoid Vaccine (parenteral) *see* Vaccines

Ubidecarenone

Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of warfarin

Ulcer-healing Drugs *see* Histamine H_2-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

Ulipristal

- Antacids: manufacturer of ulipristal advises avoid concomitant use with •antacids (plasma concentration of ulipristal possibly reduced)
- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with •rifampicin (contraceptive effect of ulipristal possibly reduced)
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with •St John's wort (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with •carbamazepine and •phenytoin (contraceptive effect of ulipristal possibly reduced)
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with •ritonavir (contraceptive effect of ulipristal possibly reduced)
- Barbiturates: manufacturer of ulipristal advises avoid concomitant use with •phenobarbital (contraceptive effect of ulipristal possibly reduced)
- Progestogens: ulipristal possibly reduces contraceptive effect of •progestogens
- Ulcer-healing Drugs: manufacturer of ulipristal advises avoid concomitant use with •histamine H_2-antagonists and •proton pump inhibitors (plasma concentration of ulipristal possibly reduced)

Ursodeoxycholic Acid

Antacids: absorption of bile acids possibly reduced by antacids

- Ciclosporin: ursodeoxycholic acid increases absorption of •ciclosporin

Lipid-regulating Drugs: absorption of bile acids possibly reduced by colestipol and colestyramine

Oestrogens: elimination of cholesterol in bile increased when bile acids given with oestrogens

Ustekinumab

- Vaccines: avoid concomitant use of ustekinumab with live •vaccines (see p. 746)

Vaccines

Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 746 ; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 769

- Abatacept: avoid concomitant use of live vaccines with •abatacept (see p. 746)
- Adalimumab: avoid concomitant use of live vaccines with •adalimumab (see p. 746)
- Anakinra: avoid concomitant use of live vaccines with •anakinra (see p. 746)

Antibacterials: oral typhoid vaccine inactivated by antibacterials–see p. 767

Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of warfarin

Antiepileptics: influenza vaccine enhances effects of phenytoin

Antimalarials: oral typhoid vaccine inactivated by antimalarials–see p. 767

- Certolizumab pegol: avoid concomitant use of live vaccines with •certolizumab pegol (see p. 746)
- Corticosteroids: immune response to vaccines impaired by high doses of •corticosteroids, avoid concomitant use with live vaccines (see p. 746)
- Etanercept: avoid concomitant use of live vaccines with •etanercept (see p. 746)
- Golimumab: avoid concomitant use of live vaccines with •golimumab (see p. 746)
- Infliximab: avoid concomitant use of live vaccines with •infliximab (see p. 746)

Interferons: avoidance of vaccines advised by manufacturer of interferon gamma

- Leflunomide: avoid concomitant use of live vaccines with •leflunomide (see p. 746)

Theophylline: influenza vaccine possibly increases plasma concentration of theophylline

- Tocilizumab: avoid concomitant use of live vaccines with •tocilizumab (see p. 746)
- Ustekinumab: avoid concomitant use of live vaccines with •ustekinumab (see p. 746)

Valaciclovir *see* Aciclovir

Valganciclovir *see* Ganciclovir

Valproate

Analgesics: effects of valproate enhanced by aspirin

- Antibacterials: metabolism of valproate possibly inhibited by erythromycin (increased plasma concentration); plasma concentration of valproate reduced by •carbapenems—avoid concomitant use

Anticoagulants: valproate possibly enhances anticoagulant effect of coumarins

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort
- Antiepileptics: plasma concentration of valproate reduced by carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of ethosuximide; valproate increases plasma concentration of lamotrigine; valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of •primidone (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rufinamide (reduce dose of rufinamide); CNS toxicity reported when valproate given with topiramate

Valproate *(continued)*

- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine
- Antipsychotics: anticonvulsant effect of valproate antagonised by •antipsychotics (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of clozapine; increased risk of side-effects including neutropenia when valproate given with •olanzapine; valproate possibly increases plasma concentration of quetiapine

Antivirals: valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity)

Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clobazam; increased risk of side-effects when valproate given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam

Barbiturates: valproate increases plasma concentration of phenobarbital (also plasma concentration of valproate reduced)

Bupropion: valproate inhibits the metabolism of bupropion

Cytotoxics: valproate increases plasma concentration of temozolomide

Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine

Oestrogens: plasma concentration of valproate possibly reduced by ethinylestradiol

- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Sodium Benzoate: valproate possibly reduces effects of sodium benzoate

Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate

- Ulcer-healing Drugs: metabolism of valproate inhibited by •cimetidine (increased plasma concentration)

Valsartan *see* Angiotensin-II Receptor Antagonists

Vancomycin

Anaesthetics, General: hypersensitivity-like reactions can occur when *intravenous* vancomycin given with general anaesthetics

- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with •aminoglycosides, capreomycin or colistin; increased risk of nephrotoxicity when vancomycin given with polymyxins

Antifungals: possible increased risk of nephrotoxicity when vancomycin given with amphotericin

- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with •ciclosporin

Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with cisplatin

- Diuretics: increased risk of otoxicity when vancomycin given with •loop diuretics

Lipid-regulating Drugs: effects of *oral* vancomycin antagonised by colestyramine

- Muscle Relaxants: vancomycin enhances effects of •suxamethonium

Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine–see p. 767

Vardenafil

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with •alpha-blockers (excludes tamsulosin)—separate doses by 6 hours—see also p. 515

Antibacterials: plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil)

- Antifungals: plasma concentration of vardenafil increased by •ketoconazole—avoid concomitant use; plasma concentration of vardenafil possibly increased by •itraconazole—avoid concomitant use

Vardenafil *(continued)*

- Antivirals: plasma concentration of vardenafil possibly increased by fosamprenavir; plasma concentration of vardenafil increased by •indinavir and •ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with •saquinavir—avoid concomitant use

Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with nifedipine

- Grapefruit Juice: plasma concentration of vardenafil possibly increased by •grapefruit juice—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with •nicorandil—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with •nitrates—avoid concomitant use

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alcohol

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics

Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with tricyclic-related antidepressants

Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with clonidine

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diazoxide

Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diuretics

Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with levodopa

Vasodilator Antihypertensives *(continued)*
Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with methyldopa
Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with moxisylyte
Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with baclofen; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with tizanidine
Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nicorandil
Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with nitrates
Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alprostadil
Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with minoxidil or sodium nitroprusside; enhanced hypotensive effect when minoxidil given with sodium nitroprusside

Vecuronium *see* Muscle Relaxants

Venlafaxine
- Analgesics: increased risk of bleeding when venlafaxine given with ●NSAIDs or ●aspirin; possible increased serotonergic effects when venlafaxine given with tramadol
- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of ●warfarin
- Antidepressants: possible increased serotonergic effects when venlafaxine given with St John's wort, duloxetine or mirtazapine; enhanced CNS effects and toxicity when venlafaxine given with ●MAOIs (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start ●moclobemide for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●artemether/lumefantrine
- Antipsychotics: venlafaxine increases plasma concentration of ●clozapine and haloperidol
  Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Dopaminergics: caution with venlafaxine advised by manufacturer of entacapone; increased risk of hypertension and CNS excitation when venlafaxine given with ●selegiline (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
  $5HT_1$ Agonists: possible increased serotonergic effects when venlafaxine given with $5HT_1$ agonists
  Lithium: possible increased serotonergic effects when venlafaxine given with lithium

Verapamil *see* Calcium-channel Blockers

Vigabatrin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with ●St John's wort
  Antiepileptics: vigabatrin reduces plasma concentration of phenytoin; vigabatrin possibly reduces plasma concentration of primidone
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by ●mefloquine
  Barbiturates: vigabatrin possibly reduces plasma concentration of phenobarbital
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

Vildagliptin *see* Antidiabetics

Vinblastine
- Aldesleukin: avoidance of vinblastine advised by manufacturer of ●aldesleukin
- Antibacterials: toxicity of vinblastine increased by ●erythromycin—avoid concomitant use
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vinblastine possibly inhibited by ●posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Antivirals: plasma concentration of vinblastine possibly increased by ritonavir
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vincristine
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vincristine possibly inhibited by ●itraconazole and ●posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Calcium-channel Blockers: metabolism of vincristine possibly inhibited by nifedipine
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vinflunine
- Antibacterials: plasma concentration of vinflunine possibly reduced by ●rifampicin—manufacturer of vinflunine advises avoid concomitant use
- Antidepressants: plasma concentration of vinflunine possibly reduced by ●St John's wort—manufacturer of vinflunine advises avoid concomitant use
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of vinflunine increased by ●ketoconazole—manufacturer of vinflunine advises avoid concomitant use; plasma concentration of vinflunine possibly increased by ●itraconazole—manufacturer of vinflunine advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinflunine possibly increased by ●ritonavir—manufacturer of vinflunine advises avoid concomitant use
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
  Grapefruit Juice: plasma concentration of vinflunine possibly increased by grapefruit juice—manufacturer of vinflunine advises avoid concomitant use

Vinorelbine
- Antibacterials: possible increased risk of neutropenia when vinorelbine given with ●clarithromycin
  Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vinorelbine possibly inhibited by ●itraconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
  Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vitamin A *see* Vitamins

Vitamin D *see* Vitamins

Vitamin E *see* Vitamins

Vitamin K (Phytomenadione) *see* Vitamins

Vitamins

Antibacterials: absorption of vitamin A possibly reduced by neomycin

- Anticoagulants: vitamin E possibly enhances anticoagulant effect of •coumarins; vitamin K antagonises anticoagulant effect of •coumarins and •phenindione

Antiepileptics: vitamin D requirements possibly increased when given with carbamazepine, phenytoin or primidone

Antifungals: plasma concentration of paricalcitol possibly increased by ketoconazole

Antivirals: increased risk of bleeding when high doses of vitamin E given with tipranavir

Barbiturates: vitamin D requirements possibly increased when given with barbiturates

Ciclosporin: vitamin E possibly affects plasma concentration of ciclosporin

Diuretics: increased risk of hypercalcaemia when vitamin D given with thiazides and related diuretics

Dopaminergics: pyridoxine reduces effects of levodopa when given without dopa-decarboxylase inhibitor

Retinoids: risk of hypervitaminosis A when vitamin A given with retinoids

Selenium: ascorbic acid possibly reduces absorption of selenium (give at least 4 hours apart)

Voriconazole *see* Antifungals, Triazole

Warfarin *see* Coumarins

Xipamide *see* Diuretics

Xylometazoline *see* Sympathomimetics

Zafirlukast *see* Leukotriene Receptor Antagonists

Zaleplon *see* Anxiolytics and Hypnotics

Zidovudine

Note Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature

Analgesics: increased risk of haematological toxicity when zidovudine given with NSAIDs; plasma concentration of zidovudine possibly increased by methadone

Antibacterials: absorption of zidovudine reduced by clarithromycin tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with rifampicin

Antiepileptics: zidovudine increases or decreases plasma concentration of phenytoin; plasma concentration of zidovudine possibly increased by valproate (increased risk of toxicity)

- Antifungals: plasma concentration of zidovudine increased by •fluconazole (increased risk of toxicity)

Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine

- Antivirals: profound myelosuppression when zidovudine given with •ganciclovir (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of anaemia when zidovudine given with •ribavirin—avoid concomitant use; zidovudine possibly inhibits effects of •stavudine (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by •tipranavir

Atovaquone: metabolism of zidovudine possibly inhibited by atovaquone (increased plasma concentration)

- Probenecid: excretion of zidovudine reduced by •probenecid (increased plasma concentration and risk of toxicity)

Zinc

Antibacterials: zinc reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; zinc reduces absorption of tetracyclines, also absorption of zinc reduced by tetracyclines

Calcium Salts: absorption of zinc reduced by calcium salts

Eltrombopag: zinc possibly reduces absorption of eltrombopag (give at least 4 hours apart)

Zinc *(continued)*

Iron: absorption of zinc reduced by *oral* iron, also absorption of *oral* iron reduced by zinc

Penicillamine: absorption of zinc reduced by penicillamine, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by trientine, also absorption of trientine reduced by zinc

Zoledronic Acid *see* Bisphosphonates

Zolmitriptan *see* $5HT_1$ Agonists

Zolpidem *see* Anxiolytics and Hypnotics

Zonisamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with •St John's wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin

- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by •mefloquine

Barbiturates: plasma concentration of zonisamide reduced by phenobarbital

- Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Zopiclone *see* Anxiolytics and Hypnotics

Zuclopenthixol *see* Antipsychotics

A2–5 Liver disease, renal impairment, pregnancy, and breast-feeding

For general guidance on prescribing for patients with hepatic or renal impairment, or for patients who are pregnant or breast-feeding, see pp. 17–19. Specific information has been moved to the relevant chapters and is included under the individual drug or in the prescribing notes.

A6 Intravenous additives

Intravenous additives policies A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embo-

lism. Only specially formulated products such as *Vitlipid N*® (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. amphotericin, dacarbazine, and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

Use of table

The table lists preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition *via* the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically *via* the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made *via* the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Table of drugs given by intravenous infusion

Covers addition to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer

Abatacept (*Orencia®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

Abciximab (*ReoPro®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose in infusion fluid and give *via* infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter *or* upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter

Acetylcysteine (*Parvolex®*)

Continuous *in* Glucose 5% or Sodium chloride 0.9%

Glucose 5% is preferable—see Emergency Treatment of Poisoning

Aciclovir (as sodium salt) (*Zovirax IV®*; *Aciclovir IV*, Hospira; *Aciclovir IV*, Genus; *Aciclovir Sodium*, Zurich)

Intermittent *in* Sodium chloride 0.9% *or* Sodium chloride and glucose

For *Zovirax IV®*, *Aciclovir IV* (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour

Agalsidase alfa (*Replagal®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution

Agalsidase beta (*Fabrazyme®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL; dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

Alfentanil (as hydrochloride) (*Rapifen®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Alglucosidase alfa (*Myozyme®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

Alteplase (*Actilyse®*)

Continuous *or* intermittent *in* Sodium chloride 0.9%

Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution

Amifostine (*Ethyol®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 500-mg vial with 9.7 mL sodium chloride 0.9% to produce a 50 mg/mL solution

Amikacin sulphate (*Amikin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

To be given over 30 minutes

Aminophylline

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Amiodarone hydrochloride (*Cordarone X®*)

Continuous *or* intermittent *in* Glucose 5%

Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; infusion in extreme emergency see section 2.7.3; should not be diluted to less than 600 micrograms/mL; incompatible with sodium chloride infusion; avoid equipment containing the plasticizer di-2-ethylhexyphthalate (DEHP)

Amoxicillin (as sodium salt) (*Amoxil®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Continuous infusion not usually recommended

Amphotericin (lipid complex) (*Abelcet®*)

Intermittent *in* Glucose 5%

Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

Amphotericin (liposomal) (*AmBisome®*)

Intermittent *in* Glucose 5% or 10%

Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line

Amphotericin (as sodium deoxycholate complex) (*Fungizone®*)

Intermittent *in* Glucose 5%

Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used

Ampicillin sodium (*Penbritin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Continuous infusion not usually recommended

Anidulafungin (*Ecalta®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 100 mg with 30 mL water for injections, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute

Note Follow product information if using stock supplied with ethanol solvent

Antithymocyte immunoglobulin (*Thymoglobuline®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion as precipitation reported

Atenolol (*Tenormin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested infusion time 20 minutes

Atosiban (*Tractocile®* concentrate for intravenous infusion)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL

Atracurium besilate (*Tracrium®*; *Atracurium besilate injection*, Hospira; *Atracurium injection/infusion*, Genus)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL

Azathioprine (as sodium salt) (*Imuran®*)

Intermittent *in* Sodium chloride 0.9% *or* Glucose 5%

Reconstitute 50 mg with 5–15 mL water for injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid

Aztreonam (*Azactam®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

Basiliximab (*Simulect®*)

Intermittent in Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes

Benzylpenicillin sodium (*Crystapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 100 mL given over 30–60 minutes

Continuous infusion not usually recommended

Betamethasone (as sodium phosphate) (*Betnesol®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Bivalirudin (*Angiox®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

Bumetanide

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 500 mL given over 30–60 minutes; concentrations above 25 micrograms/mL may cause precipitation

Calcitonin (salmon) (*Miacalcic®*)

Intermittent *in* Sodium chloride 0.9%

Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

Calcium gluconate

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Avoid bicarbonates, phosphates, or sulphates

Caspofungin (*Cancidas®*)

Intermittent *in* Sodium chloride 0.9%

Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

Cefotaxime (as sodium salt)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Water for injections

Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

Ceftazidime (as pentahydrate) (*Fortum®*, *Kefadim®*)

Intermittent *or via* drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid; for *Fortum®* dilute further to a concentration of 40 mg/mL; for *Kefadim®* dilute further to a concentration of 20 mg/mL; give over up to 30 minutes

Ceftriaxone (as sodium salt) (*Rocephin®*; *Ceftriaxone Injection*, Genus)

Intermittent *or via* drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Reconstitute 2-g vial with 40 mL infusion fluid; give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites

Cefuroxime (as sodium salt) (*Zinacef®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes

Chloramphenicol (as sodium succinate) (*Kemicetine®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Ciclosporin (*Sandimmun®*)

Intermittent *or* continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

Cidofovir (*Vistide®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

Cisatracurium (*Nimbex®*, *Nimbex Forte®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL

Clarithromycin (*Klaricid® I.V.*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes

Clindamycin (as phosphate) (*Dalacin® C Phosphate*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion)

Clonazepam (*Rivotril®*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Suggested volume 250 mL

Co-amoxiclav (*Augmentin®*)

Intermittent *in* Sodium chloride 0.9% *or* Water for injections

Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes

via drip tubing *in* Sodium chloride 0.9%

Co-fluampicil (as sodium salts) (*Magnapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Colistimethate sodium (*Colomycin®*)

Intermittent *in* Sodium chloride 0.9% *or* Water for injections

Dilute with 50 mL infusion fluid and give over 30 minutes

Co-trimoxazole (*Septrin® for infusion*)

Intermittent *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes

Cyclophosphamide (*Cyclophosphamide injection*, Baxter)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%

Danaparoid sodium (*Orgaran®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Daptomycin (*Cubicin®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes

Desferrioxamine mesilate (*Desferal®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid

Desmopressin (*DDAVP®*, *Octim®*)

Intermittent *in* Sodium chloride 0.9%

Dilute with 50 mL and give over 20 minutes

Dexamethasone sodium phosphate (*Dexamethasone*, Hospira; *Dexamethasone*, Organon)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Dexrazoxane (*Cardioxane®*)

Intermittent *in* Compound sodium lactate

Reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes

Dexrazoxane (*Savene®*)

Intermittent *in Savene®* diluent

Reconstitute 500 mg with 25 mL of water for injections then dilute in 500 mL *Savene®* diluent; give over 1–2 hours into a large vein in an area other than the one affected

Diamorphine hydrochloride (*Diamorphine Injection*, Wockhardt)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Glucose is preferred as infusion fluid

Diazepam (solution) (*Diazepam*, Wockhardt)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 10 mg in 200 mL; adsorbed to some extent by the plastics of bags and infusion sets

Diazepam (emulsion) (*Diazemuls®*)

Continuous *in* Glucose 5 and 10%

May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of the infusion set

via drip tubing *in* Glucose 5 and 10% *or* Sodium chloride 0.9%

Adsorbed to some extent by the plastics of the infusion set

Diclofenac sodium (*Voltarol®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution *or* with 1 mL sodium bicarbonate 4.2% solution); for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

Digoxin (*Lanoxin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours

Digoxin-specific antibody fragments (*Digibind®*)

Intermittent *in* Sodium chloride 0.9%

Dissolve initially in water for injections (4 mL/vial) then dilute with the sodium chloride 0.9% and give through a 0.22 micron sterile, disposable filter over 30 minutes

Dinoprostone (*Prostin E2®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Disodium pamidronate (*Aredia®*; *Disodium pamidronate*, Britannia, Hospira, Medac)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

For *Aredia®* and *Pamidronate disodium* (Britannia), reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for *Aredia®*, *Pamidronate disodium* (Britannia), *Disodium pamidronate* (Hospira), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL; for *Disodium pamidronate* (Medac) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

Disopyramide (as phosphate) (*Rythmodan®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

Dobutamine (as hydrochloride)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 0.5–1 mg/mL and give *via* a controlled infusion device; give higher concentration (max. 5 mg/mL) with infusion pump; incompatible with bicarbonate

Dopamine hydrochloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate

Dopexamine hydrochloride (*Dopacard®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 400 or 800 micrograms/mL; max. concentration *via* large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused *via* central vein; give *via* infusion pump or other device which provides accurate control of rate; contact with metal should be minimised; incompatible with bicarbonate

Doripenem (*Doribax®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 500 mg with 10 mL water for injections or sodium chloride 0.9% then dilute with 100 mL infusion fluid; give over 1 hour (for severe hospital-acquired pneumonia or hospital-acquired pneumonia caused by less sensitive organisms, may extend infusion time to 4 hours using sodium chloride 0.9% as the infusion fluid)

Eculizumab (*Soliris®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

Enoximone (*Perfan®*)

Continuous *or* intermittent *in* Sodium chloride 0.9% *or* Water for injections

Dilute to a concentration of 2.5 mg/mL; incompatible with glucose solutions; use only plastic containers or syringes

Epoprostenol (*Flolan®*)

Continuous *in* Sodium chloride 0.9% (but see also below)

Reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for *pulmonary hypertension* dilute further with glycine buffer diluent only, for *renal dialysis* may be diluted further with sodium chloride 0.9%

Ertapenem (*Invanz®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

Erythromycin (as lactobionate)

Continuous *or* intermittent *in* Glucose 5% (neutralised with sodium bicarbonate) *or* Sodium chloride 0.9%

Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1 mg/mL for continuous infusion and 1–5 mg/mL for intermittent infusion; give intermittent infusion over 20–60 minutes

Esomeprazole (as sodium salt) (*Nexium®*)

Continuous *or* intermittent *in* Sodium chloride 0.9%

Reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in sodium chloride 0.9%

Ethanol

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 5–10%

Fentanyl (*Sublimaze®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Ferric carboxymaltose (*Ferinject®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

Filgrastim (*Neupogen®*; *Nivestim®*; *Ratiograstim®*; *Tevagrastim®*; *Zarzio®*)

Continuous *or* intermittent *in* Glucose 5%

For a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution

Flecainide acetate (*Tambocor®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Minimum volume in infusion fluids containing chlorides 500 mL

Flucloxacillin (as sodium salt) (*Floxapen®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 100 mL given over 30–60 minutes

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Continuous infusion not usually recommended

Flumazenil (*Anexate®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Fondaparinux (*Arixtra®*)

Intermittent *in* Sodium chloride 0.9%

For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant (*Ivemend®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 115-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 110 mL infusion fluid; give over 15 minutes

Foscarnet sodium (*Foscavir®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution *via* central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours)

Fosphenytoin Sodium (*Pro-Epanutin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent)/mL

Furosemide (as sodium salt) (*Lasix®*)

Continuous *in* Sodium chloride 0.9%

Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable

Fusidic acid (as sodium salt)

Continuous *in* Glucose 5% (but see below) *or* Sodium chloride 0.9%

Reconstitute with the buffer solution provided and dilute to 500 mL; give through central venous line over 2 hours (or over 6 hours if superficial vein used); incompatible in solution of pH less than 7.4

Galsulfase (*Naglazyme®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours

Ganciclovir (as sodium salt) (*Cymevene®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially in water for injections (500 mg/10 mL) then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour

Gentamicin (as sulphate) (*Cidomycin®*; *Gentamicin Paediatric Injection*, Beacon; *Gentamicin Injection*, Hospira)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume for intermittent infusion 50–100 mL given over 20–30 minutes (given over 60 minutes for once daily dose regimen)

Glyceryl trinitrate (*Nitrocine®*, *Nitronal®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

For *Nitrocine®* suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as *Viaflex®* or *Steriflex®*; use glass or polyethylene containers or give *via* a syringe pump

Granisetron (as hydrochloride) (*Kytril®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 3 mL in 20–50 mL infusion fluid (up to 3 mL in 10–30 mL for children); give over 5 minutes

Haem arginate (*Normosang®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes *via* large antebrachial vein; administer within 1 hour after dilution

Heparin sodium

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Administration with a motorised pump advisable

Hydralazine hydrochloride (*Apresoline®*)

Continuous *in* Sodium chloride 0.9%

Suggested infusion volume 500 mL

Hydrocortisone (as sodium phosphate) (*Efcortesol®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Hydrocortisone (as sodium succinate) (*SoluCortef®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Hydroxocobalamin (*Cyanokit®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 2.5 g-vial with 100 mL infusion fluid; gently invert vial for at least 30 seconds to mix; do not shake

Ibandronic acid (*Bondronat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours

Idursulfase (*Elaprase®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

Imiglucerase (*Cerezyme®*)

Intermittent *in* Sodium chloride 0.9%

Initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution

Imipenem with cilastatin (as sodium salt) (*Primaxin®*)

Intermittent *in* Sodium chloride 0.9% *or* Sodium chloride and Glucose

Dilute to a concentration of 5 mg (as imipenem)/mL; infuse 250–500 mg (as imipenem) over 20–30 minutes, 1 g over 40–60 minutes

Continuous infusion not usually recommended

Infliximab (*Remicade®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (patients being treated for rheumatoid arthritis who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution

Insulin (soluble)

Continuous *in* Sodium chloride 0.9%

Adsorbed to some extent by plastics of infusion set; see also section 6.1.3; ensure insulin is not injected into 'dead space' of injection port of the infusion bag

Insulin aspart

Continuous *in* Sodium chloride 0.9% *or* Glucose 5%

Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set

Insulin glulisine (*Apidra®*)

Continuous in Sodium chloride 0.9%

Dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line

Insulin lispro

Continuous *in* Sodium chloride 0.9% *or* Glucose 5%

Adsorbed to some extent by plastics of infusion set

Iron dextran (*Cosmofer®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 6.67 mg/minute; *total dose infusion* diluted in 500 mL infusion fluid and given over 4–6 hours (initial test dose 25 mg over 15 minutes)

Iron isomaltoside 1000 (*Monofer®*)

Intermittent *in* Sodium chloride 0.9%

For details consult product literature

Iron sucrose (*Venofer®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 3.33 mg/minute

Isosorbide dinitrate (*Isoket 0.05%®*, *Isoket 0.1%®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give *via* a syringe pump; *Isoket 0.05%®* can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe

Itraconazole (*Sporanox®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 250 mg in 50 mL infusion fluid and infuse only **60 mL** through an in-line filter (0.2 micron) over 60 minutes

Ketamine (as hydrochloride) (*Ketalar®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to 1 mg/mL; microdrip infusion for maintenance of anaesthesia

Labetalol hydrochloride (*Trandate®*)

Intermittent *in* Glucose 5% *or* Sodium chloride and glucose

Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette

Lacosamide (*Vimpat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

May be administered undiluted

Laronidase (*Aldurazyme®*)

Intermittent *in* Sodium chloride 0.9%

Body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through an in-line filter (0.22 micron) at an initial rate of 2 units/kg/hour then increasing gradually every 15 minutes to max. 43 units/kg/hour

Lenograstim (*Granocyte®*)

Intermittent *in* Sodium chloride 0.9%

Initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte-13* or up to 100 mL infusion fluid for *Granocyte-34*; give over 30 minutes

Lepirudin (*Refludan®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections *or* sodium chloride 0.9% then dilute to a concentration of 2 mg/mL with infusion fluid

Levetiracetam (*Keppra®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose with at least 100 mL of infusion fluid; give over 15 minutes

Magnesium sulphate

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested concentration up to 200 mg/mL; max. rate 150 mg/minute

Meropenem (*Meronem®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes

Metaraminol (as tartrate) (*Aramine®*)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Suggested volume 500 mL

Methylprednisolone (as sodium succinate) (*Solu-Medrone®*)

Continuous *or* intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes

Metoclopramide hydrochloride (*Maxolon High Dose®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Continuous infusion recommended; loading dose, dilute with 50–100 mL and give over 15–20 minutes; maintenance dose, dilute with 500 mL and give over 8–12 hours; for intermittent infusion dilute with at least 50 mL and give over at least 15 minutes

Micafungin (*Mycamine®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect infusion from light; give over 60 minutes

Midazolam (*Hypnovel®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

For neonates and children under 15 kg dilute to a max. concentration of 1 mg/mL

Milrinone (*Primacor®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a suggested concentration of 200 micrograms/mL

Mivacurium (as chloride) (*Mivacron®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 500 micrograms/mL; may also be given undiluted

Mycophenolate mofetil (as hydrochloride) (*CellCept®*)

Intermittent *in* Glucose 5%

Reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours

Naloxone (*Minijet® Naloxone Hydrochloride*)

Continuous *in* Glucose 5%

Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see Emergency Treatment of Poisoning

Natalizumab (*Tysabri®*)

Intermittent *in* Sodium chloride 0.9%

Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

Nimodipine (*Nimotop®*)

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Not to be added to infusion container; administer *via* an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

Nizatidine (*Axid®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

Noradrenaline acid tartrate/Norepinephrine bitartrate

Continuous *in* Glucose 5% *or* Sodium chloride and glucose

Give *via* controlled infusion device; for administration *via* syringe pump, dilute 4 mg noradrenaline acid tartrate (2 mL solution) with 48 mL; for administration *via* drip counter dilute 40 mg (20 mL solution) with 480 mL; give through a central venous catheter; incompatible with alkalis

Omeprazole (as sodium salt) (*Losec®*)

Intermittent *or* continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% *or* 12 hours in sodium chloride 0.9%

Ondansetron (as hydrochloride) (*Zofran®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

For intermittent infusion, dilute 32 mg in 50–100 mL and give over at least 15 minutes

Oxycodone hydrochloride (*OxyNorm®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of 1 mg/mL

Oxytocin (*Syntocinon®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Preferably given *via* a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for *induction or enhancement of labour*, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for *treatment of postpartum uterine haemorrhage* dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential

Pantoprazole (as sodium sesquihydrate) (*Protium®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes

Paracetamol (*Perfalgan®*)

Intermittent *in* Sodium chloride 0.9% *or* Glucose 5%

Dilute to a concentration of 1 mg/mL and use within 1 hour; may also be given undiluted

Pentamidine isetionate (*Pentacarinat®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in water for injections (300 mg in 3–5 mL) then dilute in 50–250 mL; give over at least 60 minutes

Phenoxybenzamine hydrochloride

Intermittent *in* Sodium chloride 0.9%

Dilute in 200–500 mL infusion; give over at least 2 hours; max. 4 hours between dilution and completion of administration

Phenylephrine hydrochloride

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute 10 mg in 500 mL infusion fluid

Phenytoin sodium (*Epanutin®*)

Intermittent *in* Sodium chloride 0.9%

Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute (neonates, give at a rate of 1–3 mg/kg/minute); complete administration within 1 hour of preparation

Phytomenadione (in mixed micelles vehicle) (*Konakion® MM*)

Intermittent *in* Glucose 5%

Dilute with 55 mL; may be injected into lower part of infusion apparatus

Piperacillin with tazobactam (as sodium salts)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9% *or* Water for injections

Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin®* brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid (to max. 50 mL with water for injections); give over 20–30 minutes

Potassium chloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute in a large-volume infusion; mix thoroughly to avoid 'layering', especially in non-rigid infusion containers; use ready-prepared solutions when possible

Propofol (emulsion) (*Diprivan®*; Abbott; Baxter; *Propofol-Lipuro®*, *Propofen®*, Braun; Hospira; Fresenius Kabi)

0.5%, 1%, or 2% emulsion

via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

To be administered *via* a Y-piece close to injection site; microbiological filter not recommended

1% emulsion only

Continuous *in* Glucose 5% (*or* Sodium chloride 0.9% for *Propofol-Lipuro®*, *Propofen®*, Braun, and Fresenius Kabi brands only)

Dilute to a concentration not less than 2 mg/mL; microbiological filter not recommended; administer using suitable device to control infusion rate; use glass or PVC containers (if PVC bag used it should be full—withdraw volume of infusion fluid equal to that of propofol to be added); give within 6 hours of preparation; propofol may alternatively be infused undiluted using a suitable infusion pump

Quinine dihydrochloride

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

To be given over 4 hours; see also section 5.4.1

Ranitidine (as hydrochloride) (*Zantac®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Rasburicase (*Fasturtec®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

Remifentanil (*Ultiva®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9% *or* Water for injections

Reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device)

Rifampicin (*Rifadin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours

Ritodrine hydrochloride (*Yutopar®*)

Continuous *in* Glucose 5%

Give *via* controlled infusion device, preferably a syringe pump; if syringe pump available dilute to a concentration of 3 mg/mL; if syringe pump not available dilute to a concentration of 300 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Rituximab (*MabThera®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to 1–4 mg/mL and gently invert bag to avoid foaming

Rocuronium bromide (*Esmeron®*)

Continuous *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Salbutamol (as sulphate) (*Ventolin® For Intravenous Infusion*)

Continuous *in* Glucose 5%

For *bronchodilatation* dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%; for *premature labour* dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump *or* for other infusion methods (preferably *via* controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Sodium calcium edetate (*Ledclair®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute to a concentration of not more than 3%; suggested volume 250–500 mL given over at least 1 hour

Sodium nitroprusside

Continuous *in* Glucose 5%

Infuse *via* infusion device to allow precise control; protect infusion from light. For further details consult product literature

Sodium valproate (*Epilim®*, *Episenta®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute *Epilim®* with solvent provided then dilute with infusion fluid

Streptokinase (*Streptase®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid

Tacrolimus (*Prograf®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

Teicoplanin (*Targocid®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute initially with water for injections provided; infuse over 30 minutes

Continuous infusion not usually recommended

Temocillin (*Negaban®*)

Intermittent *in* Glucose 5% or 10% *or* Sodium chloride 0.9%

Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes

Terbutaline sulphate (*Bricanyl®*)

Continuous *in* Glucose 5%

For *bronchodilatation* dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for *premature labour* dilute in glucose 5% and give *via* controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential

Ticarcillin sodium with clavulanic acid (*Timentin®*)

Intermittent *in* Glucose 5% *or* Water for injections

Suggested volume (depending on dose) glucose 5% 100–150 mL or water for injections 50–100 mL; given over 30–40 minutes

Tigecycline (*Tygacil®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes

Tirofiban (*Aggrastat®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL

Tobramycin (as sulphate) (*Nebcin®*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

Tocilizumab (*RoActemra®*)

Intermittent *in* Sodium chloride 0.9%

Dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour

Tramadol hydrochloride (*Zydol®*)

Continuous *or* intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Tranexamic acid (*Cyklokapron®*)

Continuous *in* Glucose 5% *or* Sodium chloride 0.9%

Urokinase (*Syner-KINASE®*)

Continuous *or* intermittent *in* Sodium chloride 0.9%

Vancomycin (as hydrochloride) (*Vancocin®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

Vasopressin, synthetic (*Pitressin®*)

Intermittent *in* Glucose 5%

Suggested concentration 20 units/100 mL given over 15 minutes

Vecuronium bromide (*Norcuron®*)

Continuous *or* via drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution; *alternatively* reconstitute with up to 10 mL glucose 5% *or* sodium chloride 0.9% *or* water for injections—unsuitable for further dilution if not reconstituted with water for injections. For *continuous intravenous infusion*, dilute to a concentration up to 40 micrograms/mL

Velaglucerase alfa (*VPRIV®*)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each 400–unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

Verteporfin (*Visudyne®*)

Intermittent *in* Glucose 5%

Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

Vitamins B & C (*Pabrinex® I/V High potency*)

Intermittent *or via* drip tubing *in* Glucose 5% *or* Sodium chloride 0.9%

Ampoule contents should be mixed, diluted, and administered without delay; give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

Vitamins, multiple

(*Cernevit®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dissolve initially in 5 mL water for injections (or infusion fluid)

(*Solivito N®*)

Intermittent *in* Glucose 5 and 10%

Suggested volume 500–1000 mL given over 2–3 hours; see also section 9.3

Voriconazole (*Vfend®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Reconstitute each 200 mg with 19 mL water for injections to produce a 10 mg/mL solution; dilute dose in infusion fluid to concentration of 0.5–5 mg/mL; give at a rate not exceeding 3 mg/kg/hour

Zidovudine (*Retrovir®*)

Intermittent *in* Glucose 5%

Dilute to a concentration of 2 mg/mL or 4 mg/mL and give over 1 hour

Zoledronic acid (*Zometa®*)

Intermittent *in* Glucose 5% *or* Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line; do not mix with calcium or other divalent cation-containing infusion solutions such as lactated Ringer's solution

A7 Borderline substances

A7.1 Enteral feeds (non-disease specific) 904
A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL 904
A7.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL 906
A7.1.3 Enteral feeds (non-disease specific): Child under 12 years 910
A7.2 Nutritional supplements (non-disease specific) 910
A7.2.1 Nutritional supplements: less than 5 g protein/100 mL 910
A7.2.2 Nutritional supplements: 5 g (or more) protein/100 mL 911
A7.3 Specialised formulas 915
A7.3.1 Specialised formulas: Infant and child 916
A7.3.2 Specialised formulas for specific clinical conditions 916
A7.4 Feed supplements 919
A7.4.1 High-energy supplements 919
A7.4.2 Fibre, vitamin, and mineral supplements 924
A7.5 Feed additives 925
A7.5.1 Special additives for conditions of intolerance 925
A7.5.2 Feed thickeners and pre-thickened drinks 925
A7.5.3 Flavouring preparations 925
A7.6 Foods for special diets 925
A7.6.1 Gluten-free foods 925
A7.6.2 Low-protein foods 928
A7.7 Nutritional supplements for metabolic diseases 929

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales) All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see **interactions:** Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see *BNF for Children* (Appendix 2)

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications
Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

A7.1 Enteral feeds (non-disease specific)

A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

A7.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Original (Fresenius Kabi)	Liquid (sip or tube feed) **per 100 mL**	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g[1])	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 903	Bottle: 200 mL = £1.78 Black currant, chocolate, mocha, nut, peach, vanilla Flexible pack: 500 mL = £3.45 1000 mL = £6.81 1500 mL = £10.23
Fresubin® Original Fibre (Fresenius Kabi)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 1 g)	3.4 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £3.90 1000 mL = £7.78 1500 mL = £10.69
Isosource® Fibre (Nestlé)	Liquid (tube feed) **per 100 mL**	422 kJ (100 kcal)	3.8 g cows' milk	13.6 g	3.4 g	1.4 g	Gluten-free Residual lactose	Standard, p. 903 Not suitable for child under 2 years	Flexible pack: 500 mL = £3.49 1000 mL = £6.97
Isosource® Standard (Nestlé)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g cows' milk	13.6 g	3.3 g	Nil	Gluten-free Residual lactose	Standard, p. 903	Flexible pack: 500 mL = £3.07 1000 mL = £6.13
Jevity® (Abbott)	Liquid (tube feed) **per 100 mL**	441 kJ (106 kcal)	4 g caseinates	14.1 g (sugars 470 mg)	3.47 g	1.76 g	Gluten-free Residual lactose	Standard, p. 903 except bowel fistula. Not suitable for child under 2 years	Flexible pack: 500 mL = £4.16 1000 mL = £7.81 1500 mL = £11.73
Novasource® GI Control (Nestlé)	Liquid (tube feed) **per 100 mL**	444 kJ (106 kcal)	4.1 g cows' milk	14.4 g (sugars 500 mg)	3.5 g (MCT 40 %)	2.2 g	Gluten-free Residual lactose	Standard, p. 903	Flexible pack: 500 mL = £4.78
Nutrison® (Nutricia Clinical)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose	Standard, p. 903	Bottle: 500 mL = £3.76 Flexible pack: 500 mL = £4.17 1000 mL = £7.32 1500 mL = £10.97

1. Sugar content varies with flavour

Nutrison® Multi Fibre (Nutricia Clinical)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	1.5 g	Gluten-free Residual lactose	Standard, p. 903 except bowel fistula	Bottle: 500 mL = £4.09 Flexible pack: 500 mL = £4.51 1000 mL = £8.16 1500 mL = £12.25
Osmolite® (Abbott)	Liquid (tube feed) **per 100 mL**	424 kJ (100 kcal)	4 g caseinates soy isolate	13.6 g (sugars 630 mg)	3.4 g	Nil	Gluten-free Residual lactose	Standard, p. 903	Can: 250 mL = £1.88 Bottle: 500 mL = £3.57 1000 mL = £6.81 1500 mL = £10.22
Soya protein formula									
Fresubin® Soya Fibre (Fresenius Kabi)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	3.8 g soya protein	13.3 g (sugars 4.1 g)	3.6 g	2 g	Gluten-free Lactose-free Contains fish oil	Standard, p. 903; *also* cows' milk protein intolerance, lactose intolerance	Flexible pack: 500 mL = £4.03
Nutrison® Soya (Nutricia Clinical)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose Milk protein-free	Standard, p. 903; *also* cows' milk protein and lactose intolerance	Bottle: 500 mL = £4.34 Flexible pack: 1000 mL = £8.69
Nutrison® Soya Multi Fibre (Nutricia Clinical)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 700 mg)	3.9 g	1.5 g	Gluten-free Residual lactose Milk protein-free	Standard, p. 903 except bowel fistula; *also* cows' milk protein and lactose intolerance	Flexible pack: 1500 mL = £14.46
Peptide-based formula									
Peptamen® (Nestlé)	Liquid (sip or tube feed) **per 100 mL**	420 kJ (100 kcal)	4 g whey peptides	12.7 g (sugars 480 mg[1])	3.7 g (MCT 70 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Cup (vanilla flavour): 200 mL = £2.83 Flexible pack: 500 mL = £5.86 1000 mL = £11.00
Peptisorb® (Nutricia Clinical)	Liquid (tube feed) **per 100 mL**	425 kJ (100 kcal)	4 g whey protein hydrolysate	17.6 g (sugars 1.7 g)	1.7 g (MCT 47 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Bottle: 500 mL = £5.76 Flexible pack: 500 mL = £6.31 1000 mL = £11.41
Survimed® OPD (Fresenius Kabi)	Liquid (tube feed) **per 100 mL**	420 kJ (100 kcal)	4.5 g lactalbumin hydrolysate	15 g (sugars 300 mg)	2.4 g (MCT 54 %)	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903; *also* growth failure	Flexible pack: 500 mL = £5.75

1. Sugar content varies with flavour

A7.1.1.2 Enteral feeds: Less than 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Amino acid formula (essential and non-essential amino acids)									
Elemental 028® Extra (SHS)	Liquid (sip feed) **per 100 mL**	360 kJ (86 kcal)	2.5 g (protein equivalent)	11 g (sugars 4.7 g)	3.5 g (MCT 35%)	Nil		Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Carton: 250 mL = £3.19 Grapefruit, orange-pineapple, summer fruits
	Standard dilution (20%) of powder (sip or tube feed) **per 100 mL**	374 kJ (89 kcal)[1]	2.5 g (protein equivalent)	11.8 g (sugars 1.1 g)	3.5 g (MCT 35%)	Nil			Sachet: 100 g = £6.01 Banana, citrus, orange, unflavoured[2]
Powder provides protein equivalent 12.5 g, carbohydrate 59 g, fat 17.45 g, energy 1871 kJ (443 kcal)/100 g									

1. Nutritional values vary with flavour—consult product literature
2. Flavouring: see *Modjul® Flavour System*, p. 925

A7.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL

A7.1.2.1 Enteral feeds: 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® 2250 Complete (Fresenius Kabi)	Liquid (tube feed) **per 100 mL**	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903	Flexible pack: 1500 mL = £12.25
Fresubin® Energy (Fresenius Kabi)	Liquid (sip feed) **per 100 mL**	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars[1])	5.8 g	Nil	Gluten-free[2] Residual lactose Contains fish gelatin	Standard, p. 903	Bottle: 200 mL = £1.78 Banana, black currant, cappuccino, chocolate, lemon, neutral, strawberry, tropical fruits, vanilla

1. Sugar content varies with flavour
2. Strawberry flavour may contain traces of wheat starch and egg

	Liquid (tube feed) **per 100 mL**	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.4 g)	5.8 g	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903	Flexible pack: 500 mL = £4.21 1000 mL = £8.28 1500 mL = £11.10
Fresubin® Energy Fibre (Fresenius Kabi)	Liquid (sip feed) **per 100 mL**	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars[1])	5.8 g	2 g	Gluten-free Residual lactose Contains fish gelatin	Standard, p. 903	Bottle: 200 mL = £1.87 Banana, caramel, cherry, chocolate, strawberry, vanilla
	Liquid (tube feed) **per 100 mL**	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903	Flexible pack: 500 mL = £4.63 1000 mL = £8.82
Fresubin® HP Energy (Fresenius Kabi)	Liquid (tube feed) **per 100 mL**	630 kJ (150 kcal)	7.5 g cows' milk	17 g (sugars 1 g)	5.8 g (MCT 57%)	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Standard, p. 903; *also* CAPD and haemodialysis	Flexible pack: 500 mL = £4.29 1000 mL = £8.60
Isosource® Energy Fibre (Nestlé)	Liquid (tube feed) **per 100 mL**	630 kJ (150 kcal)	4.9 g cows' milk	20.2 g	5.5 g	1.5 g	Gluten-free Residual lactose	Standard, p. 903 except bowel fistula	Flexible pack: 500 mL = £4.08 1000 mL = £8.17

A7.3 Specialised formulas

A7.3.1 Specialised formulas: Infant and child see *BNF for Children*

A7.3.2 Specialised formulas for specific clinical conditions

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alicalm® (SHS)	Standard dilution (30%) of powder **per 100 mL**	567 kJ (135 kcal)	4.5 g caseinate whey	17.4 g (sugars 3.2 g)	5.3 g	Nil	Residual lactose	Crohn's disease Not suitable for child under 1 year; use as nutritional supplement only in children 1–6 years.	Powder: 400 g = £18.08 Vanilla
Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g									
Forticare® (Nutricia Clinical)	Liquid (sip feed) **per 100 mL**	675 kJ (160 kcal)	9 g cows' milk	19.1 g (sugars 13.6 g)	5.3 g	2.1 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer Not suitable in child under 3 years	Carton: 125 mL = £2.02 Cappuccino, orange-lemon, peach-ginger
Generaid® (SHS)	Powder **per 100 g**	1586 kJ (374 kcal)	76 g protein equivalent (whey protein, plus branched chain amino acids)	5 g (sugars 5 g)	5.5 g	Nil	Electrolytes/100 g: Na^+ 6.1 mmol K^+ 10.8 mmol Ca^{2+} 6.5 mmol P^+ 6.45 mmol	Nutritional supplement for use in chronic liver disease and/or porto-hepatic encephalopathy	Tub: 400 g = £51.46 Unflavoured[1]
Generaid® Plus (SHS)	Standard dilution (22%) of powder **per 100 mL**	428 kJ (102 kcal)	2.4 g protein equivalent (whey protein, branched chain amino acids)	13.6 g (sugars 1.4 g)	4.2 g (MCT 32%)	Nil	Electrolytes/100 mL: Na^+ 0.7 mmol K^+ 2.7 mmol Ca^{2+} 1.72 mmol P^+ 1.67 mmol	Enteral feed or nutritional supplement in children over 1 year with hepatic disorders	Can: 400 g = £18.40 Unflavoured[1] (5-g measuring scoop provided)
Powder provides: protein equivalent 11 g, carbohydrate 62 g, fat 19 g, energy 1944 kJ (463 kcal)/100 g									

1. Flavouring: see *Modjul® Flavour System*, p. 925

Heparon® Junior (SHS)	Standard dilution (18%) of powder **per 100 mL**	363 kJ (86 kcal)	2 g cows' milk	11.6 g (sugars 2.9 g)	3.6 g	Nil	Contains lactose Electrolytes/100 mL: Na^+ 0.56 mmol K^+ 1.9 mmol Ca^{2+} 2.3 mmol P^+ 1.6 mmol	Enteral feed or nutritional supplement for children with acute or chronic liver failure	Can: 400 g = £18.20 (4.5-g measuring scoop provided)
Powder provides: protein 11.1 g, carbohydrate 64.2 g, fat 19.9 g, energy 2016 kJ (480 kcal)/100 g									
KetoCal® (SHS)	Standard dilution (20%) of powder **per 100 mL**	602 kJ (146 kcal)	3.1 g cows' milk with additional amino acids	600 mg (sugars 120 mg)	14.6 g (LCT 100%)	Nil	Electrolytes/100 mL: Na^+ 4.3 mmol K^+ 4.1 mmol Ca^{2+} 2.15 mmol P^+ 2.77 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet	Can: 300 g = £25.62 Vanilla, Unflavoured
Powder provides: protein 15.25 g, carbohydrate 3 g, fat 73 g, energy 3011 kJ (730 kcal)/100 g									
Kindergen® (SHS)	Standard dilution (20%) of powder **per 100 mL**	421 kJ (101 kcal)	1.5 g whey protein	11.8 mg (sugars 1.2 g)	5.3 g (LCT 93%)	Nil	Electrolytes/100 mL: Na^+ 2 mmol K^+ 0.6 mmol Ca^{2+} 2.8 mmol P^+ 3 mmol Low Vitamin A	Enteral feed or nutritional supplement for children with chronic renal failure receiving peritoneal rapid overnight dialysis	Tub: 400 g = £24.44 (5-g measuring scoop provided)
Powder provides: protein 7.5 g, carbohydrate 59 g, fat 26.3 g, energy 2104 kJ (504 kcal)/100 g									
Modulen IBD® (Nestlé)	Standard dilution (20%) of powder (sip or tube feed) **per 100 mL**	420 kJ (100 kcal)	3.6 g casein	11 g (sugars 3.98 g)	4.7 g	Nil	Gluten-free Residual lactose	Crohn's disease active phase, and in remission if malnourished	Can: 400 g = £14.38 Unflavoured[1] (8.3-g measuring scoop provided)
Powder provides: protein 18 g, carbohydrate 54 g, fat 23 g, 2070 kJ (500 kcal)/100 g									
Nepro® (Abbott)	Liquid (sip or tube feed) **per 100 mL**	838 kJ (200 kcal)[2]	7 g cows' milk	20.6 g (sugars 3.26 g)	9.6 g	1.56 g	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 3.67 mmol K^+ 2.72 mmol Ca^{2+} 3.43 mmol P^+ 2.23 mmol	Enteral feed or nutritional supplement in patients with chronic renal failure who are on haemodialysis or CAPD, or with cirrhosis, or other conditions requiring a high energy, low fluid, low electrolyte diet. Not suitable for child under 1 year; use with caution in child 1–5 years	Carton: 200 mL = £2.41 Strawberry, vanilla Flexible pack: 500 mL = £5.22 Vanilla

1. Flavouring: see *Flavour Mix*, p. 925

2. Nutritional values vary with flavour—consult product literature

A7.3.2 Specialised formulas for specific clinical conditions *(product list continued)*

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
ProSure® (Abbott)	Liquid (sip or tube feed) **per 100 mL**	529 kJ (125 kcal)[1]	6.65 g cows' milk	18.3 g (sugars 2.95 g)	2.56 g	2.07 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement for patients with pancreatic cancer Not suitable for child under 1 year; use with caution in child 1–4 years	Carton: 240 mL = £2.85 Vanilla
Renamil® (KoRa)	Powder (sip or tube feed when reconstituted) **per 100 g**	2003 kJ (477 kcal)	4.6 g cows' milk	70.8 g	19.3 g	Nil	Contains lactose Gluten-free Electrolytes/100 g: Na^+ 1.04 mmol K^+ 0.13 mmol Ca^{2+} 10.22 mmol P^+ 1.06 mmol Contains no vitamin A or vitamin D	Enteral feed or nutritional supplement for adults and children over 1 year with chronic renal failure	Sachet: 10 × 100 g = £25.40
Renapro® (KoRa) Powder provides: protein 18 g, energy 316 kJ (74 kcal)/20-g sachet	Powder **per 100 g**	1580 kJ (372 kcal)	90 g whey protein	800 mg	1 g	Nil	Gluten-free Residual lactose Electrolytes/100 g: Na^+ 23 mmol K^+ 2 mmol Ca^{2+} 4.99 mmol P^+ 4.84 mmol	Nutritional supplement for biochemically proven hypoproteinaemia and patients undergoing dialysis Not suitable for child under 1 year	Sachet: 30 × 20 g = £69.60
Renastart® (Vitaflo) Powder provides: protein 7.5 g, carbohydrate 63 g, fat 23.2 g, energy 2053 kJ (491 kcal)/100 g	Standard dilution (20%) of powder **per 100 mL**	411 kJ (98 kcal)	1.5 g cows' milk soya	12.6 g (sugars 1.2 g)	4.6 g	Nil	Contains lactose Electrolytes/100 mL: Na^+ 2.1 mmol K^+ 0.6 mmol Ca^{2+} 0.58 mmol P^+ 0.58 mmol	Dietary management of renal failure in child from birth to 10 years	Powder: 10 × 100 g = £56.93 Unflavoured (7-g measuring scoop provided)
Respifor® (Nutricia Clinical)	Liquid (sip feed) **per 100 mL**	633 kJ (150 kcal)	7.5 g cows' milk	22.5 g (sugars 6.4 g[2])	3.3 g	Nil[3]	Contains lactose	Nutritional supplement for dietary management of disease-related malnutrition in patients with chronic obstructive pulmonary disease and body-mass index less than 20.	Bottle: 125 mL = £1.85 Chocolate, strawberry, vanilla

1. Nutritional values vary with flavour—consult product literature
2. Sugar content varies with flavour
3. Fibre content varies with flavour

Suplena® (Abbott)	Liquid (sip or tube feed) **per 100 mL**	840 kJ (200 kcal)	3 g caseinates	25.5 g (sugars 2.7 g)	9.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 3.39 mmol K^+ 2.87 mmol Ca^{2+} 3.48 mmol P^+ 2.39 mmol	Enteral feed or nutritional supplement in patients with chronic or acute renal failure who are not undergoing dialysis, or with chronic or acute liver disease with fluid restriction; other conditions requiring high energy, low protein, low electrolyte, low volume enteral feed Not suitable for child under 1 year; use with caution in child 1–5 years	Can: 237 mL = £2.47 Vanilla
Supportan® (Fresenius Kabi)	Liquid (sip or tube feed) **per 100 mL**	630 kJ (150 kcal)	10 g cows' milk	12.4 g (sugars 6.1 g[1])	6.7 g (MCT 34% in tube feed)	1.2 g[2]	Gluten-free Residual lactose Contains fish oil	Enteral feed or nutritional supplement in patients with pancreatic cancer or with lung cancer undergoing chemotherapy Not suitable for child under 1 year; use with caution in child 1–4 years	Bottle: 200 mL = £2.30 Cappuccino, tropical fruits Flexible pack: 500 mL = £5.97 Unflavoured

1. Sugar content varies with flavour
2. Fibre content varies with flavour

A7.4 Feed supplements

A7.4.1 High-energy supplements

A7.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

ACBS Indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Caloreen® (Nestlé)	Powder **per 100 g**	1640 kJ (390 kcal)	Nil	96 g Maltodextrin	Nil	Nil	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Powder: 500 g = £3.52 Unflavoured (10-g measuring scoop provided)
Maxijul® Super Soluble (SHS)	Powder **per 100 g**	1615 kJ (380 kcal)	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Sachets: 4 × 132 g = £5.44 Can: 200 g = £2.19 2.5 kg = £19.25 25 kg = £130.76 Unflavoured

A7.4.1.1 High-energy supplements: carbohydrate *(product list continued)*

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

ACBS Indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Maxijul® Liquid (SHS)	Liquid **per 100 mL**	850 kJ (200 kcal)	Nil	61.9 g Glucose polymer (sugars 12.2 g)	Nil	Nil	Gluten-free Lactose-free	See above	Carton: 200 mL = £1.37 Orange, unflavoured
Polycal® (Nutricia Clinical)	Powder **per 100 g**	1630 kJ (384 kcal)	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £3.75 Neutral (5-g measuring scoop provided)
	Liquid **per 100 mL**	1050 kJ (247 kcal)	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil		Liquid not suitable for child under 3 years	Bottle: 200 mL = £1.50 Neutral, orange
S.O.S.® (Vitaflo)	Powder **per 100 g**	1590 kJ (380 kcal)	Nil	95 g (sugars 9 g)	Nil	Nil		For use as an emergency regimen in the dietary management of inborn errors of metabolism in adults and children from birth	Sachets: 30 × 21 g (*S.O.S.* 10) = £6.30; 30 × 31 g (*S.O.S.* 15) = £9.30; 30 × 42 g (*S.O.S.* 20) = £12.60; 30 × 52 g (*S.O.S.* 25) = £15.60
Contents of each sachet should be reconstituted with water to a total volume of 200 mL									
Vitajoule® (Vitaflo)	Powder **per 100 g**	1610 kJ (380 kcal)	Nil	96 g Dried glucose syrup	Nil	Nil	Gluten-free Lactose-free	See above	Can: 500 g = £3.66 2.5 kg = £17.83 25 kg = £107.39 (10-g measuring scoop provided)

A7.4.1.2 High-energy supplements: fat

Liquid supplements should be diluted before use in child under 5 years

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen® (Nutricia Clinical)	Liquid (emulsion) **per 100 mL**	1850 kJ (450 kcal)[1]	Nil	100 mg	50 g (LCT 100%)	Nil	Gluten-free Lactose-free	See above	Bottle: 200 mL = £4.00 500 mL = £9.83 Banana[2], neutral, strawberry[2]

1. Nutritional values vary with flavour—consult product literature
2. Flavour not suitable for child under 3 years

Liquigen® (SHS)	Liquid (emulsion) **per 100 mL**	1850 kJ (450 kcal)	Nil	Nil	50 g (MCT 97%) Fractionated coconut oil	Nil	Gluten-free Lactose-free	Steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinaemia Not suitable for child under 1 year	Bottle: 250 mL = £7.79
Medium-chain Triglyceride (MCT) Oil	Liquid **per 100 mL**	3515 kJ (855 kcal)	Nil	Nil	MCT 100 %	Nil		Nutritional supplement for steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	Bottle: 500 mL = £12.34
Fat and Carbohydrate									
Duobar® (SHS)	Bar **per 45 g**	1211 kJ (292 kcal)	Less than 20 mg	22.5 g (sucrose)	22.5 g	Nil	Contains phenylalanine 180 micrograms/45-g bar Gluten-free Lactose-free	See above	Bar: 45 g = £1.65 Neutral, strawberry, toffee
Duocal® (SHS)	Liquid **per 100 mL**	695 kJ (166 kcal)	Nil	23.7 g (sugars 2.1 g)	7.9 g (MCT 30%)	Nil	Contains vitamin E	See above	Bottle: 250 mL = £3.37
Duocal® Super Soluble (SHS)	Powder **per 100 g**	2061 kJ (492 kcal)	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35%)	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £15.20 (5-g measuring scoop provided)
Energivit® (SHS)	Standard dilution (15%) of powder **per 100 mL**	309 kJ (74 kcal)	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein-restricted diet	Can: 400 g = £18.49 (5-g measuring scoop provided)
Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g									
MCT Duocal® (SHS)	Powder **per 100 g**	2082 kJ (497 kcal)	Nil	72 g (sugars 10.1 g)	23.2 g (MCT 83%)	Nil		See above	Can: 400 g = £18.07

A7.4.1.3 High-energy supplements: protein

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Casilan® 90 (Heinz)	Powder **per 100 g**	1572 kJ (370 kcal)	90 g cows' milk	300 mg	1 g	Nil	Gluten-free Electrolytes/100 g: Na^+ 1.3 mmol K^+ 8.7 mmol Ca^{2+} 35 mmol P^+ 22.6 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 250 g = £6.49
Protifar® (Nutricia Clinical)	Powder **per 100 g**	1580 kJ (373 kcal)	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na^+ 1.3 mmol K^+ 1.28 mmol Ca^{2+} 33.75 mmol P^+ 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 225 g = £7.44 Unflavoured (2.5-g measuring scoop provided)
Powder provides: protein 2.2 g per 2.5-g scoopful									
Vitapro® (Vitaflo)	Powder **per 100 g**	1506 kJ (360 kcal)	75 g whey protein isolate	9 g	6 g	Nil	Contains lactose	Biochemically proven hypoproteinaemia	Tub: 250 g = £7.47 2 kg = £58.69 (5-g measuring scoop provided)
Protein and carbohydrate									
Dialamine® (SHS)	Standard dilution (20%) of powder **per 100 mL**	264 kJ (62 kcal)	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis Not suitable for child under 6 months	Can: 400 g = £61.74 Orange
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g									
ProSource® (Nutrinovo)	Liquid **per 30 mL**	420 kJ (100 kcal)	10 g collagen protein whey protein isolate	15 g (sugars 7 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Biochemically proven hypoproteinaemia Not recommended for child under 3 years	Sachet: 100 × 30 mL = £83.36 Neutral

Protein, fat, and carbohydrate

Calogen® Extra (Nutricia Clinical)	Liquid **per 100 mL**	1650 kJ (400 kcal)	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Residual lactose With vitamins, minerals, and trace elements	See above Not suitable for child under 3 years; may require dilution for child 3–5 years	Bottle: 200 mL = £4.56 Neutral, strawberry
Calshake® (Fresenius Kabi)	Powder **per 87 g**	1841 kJ (439 kcal)[1]	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Sachet: 87 g = £2.01 Banana, neutral, strawberry, vanilla 90 g = £2.01 Chocolate
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g									
Enshake® (Abbott)	Powder **per 100 g**	1893 kJ (450 kcal)[1]	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose With vitamins and minerals	See above Not suitable for child under 1 year; use with caution in child 1–6 years	Sachet: 96.5 g = £1.98 Banana, chocolate, strawberry, vanilla
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g									
Pro-Cal® (Vitaflo)	Powder **per 100 g**	2788 kJ (667 kcal)	13.5 g cows' milk	27 g	56 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 15 g = £13.51 Tub: 510 g = £12.52 1.5 kg = £25.50 12.5 kg = £181.28 25 kg = £279.36 (15-g measuring scoop provided)
Powder 15 g provides: protein 2 g, carbohydrate 4 g, fat 8.4 g, energy 418 kJ (100 kcal)									
Pro-Cal® Shot (Vitaflo)	Liquid **per 100 mL**	1393 kJ (334 kcal)	6.7 g cows' milk	13.4 g	28.2 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 1 year	Bottle: 6 × 250 mL = £26.76 Banana, neutral, strawberry[2] Starter pack 3 × 250 mL = £13.39
QuickCal® (Vitaflo)	Powder **per 100 g**	3263 kJ (780 kcal)	4.6 g cows' milk	17 g	77 g	Nil	Contains lactose	See above Not suitable for child under 1 year	Sachets: 25 × 13 g = £12.16
Powder 13 g provides: protein 600 mg, carbohydrate 2.2 g, fat 10 g, energy 418 kJ (100 kcal)									
Scandishake® Mix (Nutricia Clinical)	Powder **per 100 g**	2099 kJ (500 kcal)[1]	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 3 years	Sachet: 85 g = £2.08 Banana, caramel, chocolate, strawberry, vanilla, unflavoured
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)									

1. Nutritional values vary with flavour—consult product literature
2. Flavour not suitable for child under 3 years

A7.4.1.3 High-energy supplements: protein *(product list continued)*

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Vitasavoury® (Vitaflo)	Powder **per 100 g**	2590 kJ (619 kcal)[1]	12.7 g cows' milk	23.5 g (sugars 1.5 g)	52.3 g	6.2 g	Contains lactose	See above Not suitable for child under 3 years	Cup (200 kcal): 24 × 33 g = £26.80 Sachet (300 kcal) 10 × 50 g = £16.35 Chicken, leek and potato, mushroom, vegetable

1. Nutritional values vary with flavour—consult product literature

A7.4.2 Fibre, vitamin, and mineral supplements

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
High-fibre supplements									
Resource® Optifibre® (Nestlé)	Powder **per 100 g**	323 kJ (76 kcal)	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Standard, p. 903 except dysphagia Not suitable for child under 5 years	Sachets 16 x 10 g = £7.72 Can: 250 g = £9.51 (5-g measuring scoop provided)
Vitamin and Mineral supplements									
Metabolic Mineral Mixture® (SHS)	Powder **per 100 g**	729 kJ (175 kcal)	Nil	Nil	Nil	Nil	Contains trace elements Electrolytes/100 g: Na^+ 172 mmol K^+ 212 mmol Ca^{2+} 205 mmol P^+ 192 mmol Energy source: Calcium lactate	Mineral supplement for synthetic diets Suitable for infants (but may require further dilution)	Tub: 100 g = £10.67
Paediatric Seravit® (SHS)	Powder **per 100 g**	1275 kJ (300 kcal)	Nil	75 g (sugars 6.75 g[1])	Nil	Nil		Vitamin and mineral supplement in infants and children with restrictive therapeutic diets	Tub: 200 g = £14.37 Unflavoured[2] 200 g = £15.30 Pineapple[3] (5-g measuring scoop provided)

1. Sugar content varies with flavour
2. Flavouring: see *Modjul® Flavour System*, p. 925
3. Flavour not suitable for child under 6 months

A7.5 Feed additives

A7.5.1 Special additives for conditions of intolerance

Colief® (Forum)

Liquid, lactase 50 000 units/g, Net price 7-mL dropper bottle = £8.40

For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

Fructose (Laevulose)

For proven glucose/galactose intolerance

VSL#3® (Ferring)

Powder, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30 × 4.4-g sachets = £32.98

Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature

A7.5.2 Feed thickeners and pre-thickened drinks

For pre-thickened infant feeds see *BNF for Children* (Appendix 2)

Carobel, Instant® (Cow & Gate)

Powder, carob seed flour. Net price 135 g = £2.97

For thickening feeds in the treatment of vomiting

Nutilis® (Nutricia Clinical)

Powder, modified maize starch, gluten- and lactose-free, Net price 20 × 9-g sachets = £5.88; 225 g = £4.51.

For thickening of foods in dysphagia. Not suitable for children under 3 years

Resource® Thickened Drink (Nestlé)

Liquid, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (89 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.44

For dysphagia. Not suitable for children under 1 year

Resource® ThickenUp® (Nestlé)

Powder, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.35; 75 × 4.5-g sachet = £16.66

For thickening of foods in dysphagia. Not suitable for children under 1 year

SLO Drinks® (SLO Drinks)

Powder, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee, net price 25 × 115 mL = £7.50.

Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

Thick and Easy® (Fresenius Kabi)

Powder. Modified maize starch, net price 225-g can = £4.46; 100 × 9-g sachets = £26.35; 4.54 kg = £70.53.

Thickened Juices, liquid, modified food starch. Flavours: apple, orange, net price 118-mL pot = 58p; apple, black currant, cranberry, kiwi-strawberry, and orange, 1.42-litre bottle = £3.61.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thixo-D® (Sutherland)

Powder, modified maize starch, gluten-free. Net price 375-g tub = £7.15.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitaquick® (Vitaflo)

Powder. Modified maize starch. Net price 300 g = £6.66; 2 kg = £33.91; 6 kg = £87.83.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

A7.5.3 Flavouring preparations

Flavour Mix® (Nestlé)

Powder, flavours: banana, chocolate, coffee, lemon-lime, strawberry. Net price 60 g = £6.85

FlavourPac® (Vitaflo)

Powder, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £11.54

For use with Vitaflo's range of unflavoured protein substitutes for metabolic diseases

Modjul® Flavour System (SHS)

Powder, flavours: black currant, orange, pineapple, 100 g = £10.24; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £10.24

For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

A7.6 Foods for special diets

A7.6.1 Gluten-free foods

ACBS indications: established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

Bread

Loaves

Barkat® (Gluten Free Foods Ltd)

Gluten-free. Loaf, multigrain 500 g = £4.83. Loaf, sliced, wholemeal 500 g = £3.36. Loaf, sliced, part-baked, country-style 250 g = £3.69. Loaf, sliced, part-baked, white 550 g = £4.88. Rice bread, brown 500 g = £4.83; white 500 g = £4.83

Dietary Specials® (Nutrition Point)

Gluten-free. Loaf, sliced, multigrain, brown 400 g = £3.01; white 400 g = £3.01.

Ener-G® (General Dietary)

Gluten-free. Loaf, sliced Seattle brown 600 g = £5.28. Rice bread, sliced, brown 474 g = £4.59; white 456 g = £4.59. Rice loaf, sliced 612 g = £4.59. Tapioca bread, sliced 480 g = £4.59

Genius Gluten Free® (Genius Foods)
Gluten-free. Loaf, unsliced, brown 400 g = £2.49; white 400 g = £2.49

Glutafin® (Nutrition Point)
Gluten-free. Loaf, sliced, fibre 400 g = £3.41; white 400 g = £3.41

Glutafin® Select (Nutrition Point)
Gluten-free. Loaf, sliced, fresh, brown 400 g = £3.25; white 400 g = £3.25. Loaf, sliced, fibre 400 g = £3.12; white 400 g = £3.12. Loaf, seeded 400 g = £3.39.

Juvela® (Juvela)
Gluten-free. Loaf, sliced, fresh, fibre 400 g = £2.97; white 400 g = £3.23. Loaf, sliced, white 400 g = £3.10; fibre 400 g = £3.10. Loaf, white 400 g = £3.10; fibre 400 g = £3.10. Loaf, part-baked, fibre 400 g = £3.33; white 400 g = £3.46

Lifestyle® (Ultrapharm)
Gluten-free. Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82

Livwell® (Livwell)
Gluten-free. Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25

Pasticely® (GFF Trade)
Gluten-free. Loaf, sandwich, sliced, white 260 g = £3.29; rustic, sliced, white 260 g = £3.29.

Proceli® (Proceli)
Gluten-free. Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £2.30; sandwich 220 g = £2.30.

Sunnyvale® (Everfresh)
Gluten-free. Loaf, mixed grain, sour dough 400 g = £1.91

Ultra® (Ultrapharm)
Gluten-free. Loaf, part-baked, white 400 g = £2.46; high fibre 500 g = £3.35

Wellfoods® (Wellfoods)
Gluten-free. Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85

Baguettes, buns and rolls

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Baguette, part-baked 200 g = £3.69. Rolls, part-baked 2 x 100 g = £3.30; 6 x 50 g = £3.69

Ener-G® (General Dietary)
Gluten-free. Rolls, dinner × 6 = £3.11; white, long 4 × 55 g = £2.50; round 4 × 55 g = £2.50

Glutafin® (Nutrition Point)
Gluten-free. Baguette 2 × 175 g = £3.20. Rolls, fibre 4 × 50 g = £3.41; white 4 × 50 g = £3.41

Glutafin® Select (Nutrition Point)
Gluten-free. Rolls, fibre 4 × 65 g = £3.25; white 4 × 65 g = £3.25. Rolls, part-baked, white 4 × 50 g = £3.35; long 2 × 75 g = £2.56

Juvela® (Juvela)
Gluten-free. Rolls, fresh, fibre 5 × 85 g = £4.17; white 5 × 85 g = £4.17. Rolls, fibre 5 × 85 g = £4.18; white 5 × 85 g = £4.18. Rolls, part-baked, fibre 5 × 75 g = £4.33; white 5 × 75 g = £4.33

Lifestyle® (Ultrapharm)
Gluten-free. Rolls, brown 5 × 80 g = £2.82; high fibre 5 × 80 g = £2.82; white 5 × 80 g = £2.82

Livwell® (Livwell)
Gluten-free. Baguette, white 250 g = £2.50. Buns, toasting 4 × 50 g = £2.50. Rolls, white 4 = £2.25. Rolls, part-baked, circle (bagel) 2 × 90 g = £2.50; dinner (square) 2 × 80 g = £2.09

Pasticely® (GFF Trade)
Gluten-free. Baguette, part-baked, white 160 g = £1.99. Rolls, part-baked, white 2 × 80 g = 2.39; rustic, part-baked, white 2 × 105 g = £2.39

Proceli® (Proceli)
Gluten-free. Baguette, part-baked 2 × 125 g = £3.24. Buns 4 × 50 g = £3.26. Lunch rolls, white 8 × 34 g = £3.26. Rolls, part-baked, white, dinner 4 × 35 g = £2.18; hotdog 3 × 35 g = £2.24; long 3 × 83 g = £2.95.

Ultra® (Ultrapharm)
Gluten-free. Baguette, part-baked 2 × 200 g = £2.46. Rolls, part-baked 4 × 70 g = £2.46

Wellfoods® (Wellfoods)
Gluten-free. Burger buns 4 × 75 g = £3.95. Rolls 4 × 70 g = £3.65

Speciality breads

Livwell® (Livwell)
Gluten-free. Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 × 90 g = £3.00

Proceli® (Proceli)
Gluten-free. Flat bread (pitta), part-baked 3 × 40 g = £4.36

Cookies and biscuits

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Biscuits, coffee-style 200 g = £2.86; digestive 175 g = £2.20

Ener-G® (General Dietary)
Gluten-free. Cookies, vanilla 435 g = £5.23

Glutafin® (Nutrition Point)
Gluten-free. Biscuits, plain 200 g = £3.77; digestive 150 g = £1.94; savoury 125 g = £1.94; savoury shorts 150 g = £2.65; shortbread 100 g = £1.60; sweet (without chocolate or sultanas) 150 g = £1.94; tea 150 g = £1.94

Juvela® (Juvela)
Gluten-free. Biscuits, digestive 150 g = £2.67; savoury 150 g = £3.35; sweet 150 g = £2.52, tea 150 g = £2.67

Ultra® (Ultrapharm)
Gluten-free. Biscuits, sweet 250 g = £2.93

Crackers, crispbreads, and breadsticks

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Crackers, round (matzo) 200 g = £2.97

Dietary Specials® (Nutrition Point)
Gluten-free. Cracker bread 150 g = £1.94

Glutafin® (Nutrition Point)
Gluten-free. Crackers, high fibre 200 g = £2.64; plain 200 g = £3.16; mini 175 g = £2.70.

Juvela® (Juvela)
Gluten-free. Crispbread, plain 200 g = £4.06

Ultra® (Ultrapharm)
Gluten-free. Crackerbread 200 g = £1.77

Flour mixes and xanthan gum

Flour mixes

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, bread 500 g = £5.74. Plain 750 g = £5.88

Dietary Specials® (Nutrition Point)
Gluten-free. Flour mix, bread, white 500 g = £5.33. Cake, white 750 g = £5.33. Plain, white 500 g = £5.33

Glebe Farm® (Glebe Farm)
Gluten-free. Flour mix, bread, brown 375 g = £1.99 (seeded); bread, white and pizza 375 g = £1.99

Glutafin® (Nutrition Point)
Gluten-free. Flour mix, fibre 500 g = £5.91; white 500 g = £5.91

Glutafin Select® (Nutrition Point)
Gluten-free. Flour mix, bread, fibre 500 g = £6.06; white 500 g = £6.06. Cake 500 g = £6.06. Fibre 500 g = £6.06; white 500 g = £5.91. Pastry 500 g = £6.06

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, organic, bread, standard 500 g = £8.30; high fibre 500 g = £8.30

Il Pane di Anna® (GFF Trade)
Gluten-free. Flour mix, bread, white 500 g = £5.25. Cake, white 500 g = £5.25. Pizza base 500 g = £5.25

Juvela® (Juvela)
Gluten-free. Flour mix, fibre 500 g = £6.44; plain 500 g = £6.44; harvest 500 g = £6.44

Orgran® (Community)
Gluten-free. Flour mix, bread 450 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

Proceli® (Proceli)
Gluten-free. Flour mix, white 1 kg = £9.95

Pure® (Innovative)
Gluten-free. Flour mix, blended 1 kg = £3.90. Potato starch 500 g = £1.55. Rice, brown 500 g = £1.45; white 500 g = £1.55. Tapioca starch 500 g = £2.08. Teff, brown 1 kg = £4.40; white 1 kg = £4.40

Tobia® (Tobia Teff)
Gluten-free. Flour mix, teff, brown 1 kg = £2.95; white 1 kg = £2.95

Tritamyl® (Gluten Free Foods Ltd)
Gluten-free. Flour mix, bread, brown 1 kg = £6.60; white 2 kg = £13.20. Plain 2 kg = £13.20

Wellfoods® (Wellfoods)
Gluten-free. Flour mix, plain 1 kg = £7.65

Xanthan gum

Ener-G® (General Dietary)
Gluten-free. Xanthan gum 170 g = £7.25

Pure® (Innovative)
Gluten-free. Xanthan gum 100 g = £6.00

Pasta

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Pasta, animal shapes 500 g = £4.95; macaroni 500 g = £4.95; spaghetti 500 g = £4.95; spirals 500 g = £4.95; tagliatelle 500 g = £4.95. Buckwheat, penne 250 g = £2.48; spirals 250 g = £2.48

BiAlimenta® (Drossa)
Gluten-free. Pasta, potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60. Tubetti 500 g = £5.90

Dietary Specials® (Nutrition Point)
Gluten-free. Pasta, fusilli 500 g = £3.44; penne 500 g = £3.44; spaghetti 500 g = £3.44

Ener-G® (General Dietary)
Gluten-free. Pasta, rice-based, lasagne 454 g = £4.27; macaroni 454 g = £4.27; shells, small 454 g = £4.27; spaghetti 454 g = £4.27; vermicelli 300 g = £4.27

Glutafin® (Nutrition Point)
Gluten-free. Pasta, lasagne 250 g = £3.21; macaroni penne 500 g = £6.13; shells 500 g = £6.13; spirals 500 g = £6.13; spaghetti, long 500 g = £6.13; tagliatelle 250 g = £3.21

Juvela® (Juvela)
Gluten-free. Pasta, fusilli 500 g = £6.31; lasagne 250 g = £3.22; macaroni 500 g = £6.31; spaghetti 500 g = £6.31; tagliatelle 250 g = £3.04. Fibre, linguine 500 g = £5.79; penne 500 g = £5.79

Orgran® (Community)
Gluten-free. Pasta, rice and corn, lasagne 200 g = £3.03; macaroni 250 g = £2.35. Spirals, buckwheat 250 g = £2.35; corn 250 g = £2.35; rice and corn 250 g = £2.35; rice and millet 250 g = £2.35

Pasticely® (GFF Trade)
Gluten-free. Pasta, macaroni 500 g = £2.99; elbow 500 g = £2.99; spaghetti 500 g = £2.99.

Proceli® (Proceli)
Gluten-free. Pasta, macaroni penne 250 g = £2.95; puntini 2 × 250 g = £5.90; spaghetti, short 2 × 250 g = £5.90; spirals 250 g = £2.59

Rizopia® (PGR Health Foods)
Gluten-free. Pasta, brown rice, fusilli 500 g = £2.60; lasagne 375 g = £2.60; penne 500 g = £2.60; spaghetti 500 g = £2.60

Ultra® (Ultrapharm)
Gluten-free. Pasta, fusilli 250 g = £2.95; penne 250 g = £2.95; spaghetti 250 g = £2.95

Pizza bases

Barkat® (Gluten Free Foods Ltd)
Gluten-free. Pizza crust, rice, brown 150 g = £4.21; white 150 g = £4.21

Dietary Specials® (Nutrition Point)
Gluten-free. Pizza base 2 × 150 g = £5.27

Glutafin® (Nutrition Point)
Gluten-free. Pizza base 2 × 150 g = £5.98

Juvela® (Juvela)
Gluten-free. Pizza base 2 × 180 g = £7.70

Pasticely® (GFF Trade)
Gluten-free. Pizza base 165 g = £2.99

Proceli® (Proceli)
Gluten-free. Pizza base 2 × 250 g = £3.90

Ultra® (Ultrapharm)
Gluten-free. Pizza base 2 × 200 g = £2.65

Wellfoods® (Wellfoods)
Gluten-free. Pizza base 2 × 300 g = £8.95

A7.6.1.1 Gluten- and wheat-free foods

ACBS indications: established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

Ener-G® (General Dietary)
Gluten-free, wheat-free. Bread loaf, six flour 576 g = £3.60. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.00; long (hot dog) 4 × 119 g = £3.00. Pizza base, 3 × 124 g = £3.75

Glutafin® (Nutrition Point)
Gluten-free, wheat-free. Flour mix, bread 500 g = £6.06; fibre 500 g = £6.06. Cake mix 500 g = £6.06. Crispbread 150 g = £3.82

Heron Foods® (Gluten Free Foods Ltd)
Gluten-free, wheat-free. Flour mix, organic, bread, fibre 500 g = £8.30. Bread and cake mix 500 g = £6.33

A7.6.2 Low-protein foods

ACBS indications: inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

Bread

Ener-G® (General Dietary)
Low protein, Rice bread, 600 g = £4.71

Juvela® (Juvela)
Low protein. Loaf, sliced 400 g = £3.19. Rolls 5 × 70 g = £3.96

Loprofin® (SHS)
Low protein. Loaf, sliced 400 g = £3.35. Rolls, white 4 × 65 g = £3.12; part-baked 4 × 65 g = £3.52

PK Foods® (Gluten Free Foods Ltd)
Low protein. Loaf, white, sliced 550 g = £4.40

Ultra PKU® (Ultrapharm)
Low-protein. Loaf 400 g = £2.65

Cake, biscuits, and crackers

Harifen® (Ultrapharm)
Low protein. Cracker toast, 200 g = £2.75

Juvela® (Juvela)
Low-protein. Cookies, cinnamon 125 g = £6.67; chocolate chip 110 g = £6.67; orange 125 g = £6.67

Loprofin® (SHS)
Low-protein. Crunch bar 8 × 41 g = £11.92. Wafers, chocolate 100 g = £2.17; vanilla 100 g = £2.17. Crackers 150 g = £3.05, herb 150 g = £3.05

PK Foods® (Gluten Free Foods Ltd)
Low-protein. *Aminex®* biscuits 200 g = £4.67; cookies 150 g = £4.67. Cookies, chocolate chip 150 g = £4.67; cinnamon 150 g = £4.67; orange 150 g = £4.67. Rusks 200 g = £4.67. Cripsbread 75 g = £2.24

Taranis® (Firstplay Dietary)
Low-protein. Cake bars, apricot 6 × 40 g = £5.77, lemon 6 × 40 g = £5.51, pear 6 × 40 g = £5.77

Vita Bite® (Vitaflo)
Low protein. Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, 25 g = £1.02.
Not recommended for any child under 1 year

Cereals

Loprofin® (SHS)
Low-protein. Breakfast cereal flakes, apple 375 g = £6.70; chocolate 375 g = £6.70; strawberry 375 g = £6.70. Cereal loops 375 g = £6.95

Promin® (Firstplay Dietary)
Low-protein. Hot breakfast (powder sachets), apple and cinnamon 6 × 57 g = £7.35, banana 6 × 57 g = £7.35, chocolate 6 × 57 g = £7.35; original 6 × 56 g = £7.35

Desserts

Loprofin® (SHS)
Low-protein. Powder, chocolate 150 g = £4.10; strawberry 150 g = £4.10; vanilla 150 g = £4.10

PK Foods® (Gluten Free Foods Ltd)
Low-protein. Jelly, orange 4 × 80 g = £7.43, cherry 4 × 80 g = £7.43

Promin® (Firstplay Dietary)
Low-protein. Dessert mix, caramel 6 × 36.5 g = £5.77; custard 6 × 36.5 g = £5.77; chocolate and banana 6 × 36.5 g = £5.77; strawberry and vanilla 6 × 36.5 g = £5.77. Rice pudding imitation, apple 4 × 69 g = £5.77; banana 4 × 69 g = £5.77; original 4 × 69 g = £5.77; strawberry 4 × 69 g = £5.77

Flour mixes and egg substitutes

Ener-G® (General Dietary)
Low-protein. Egg replacer 454 g = £4.34

Fate® (Fate)
Low protein. All purpose mix 500 g = £6.66. Cake mix, 2 × 250 g = £6.66; chocolate-flavour 2 × 250 g = £6.66

Juvela® (Juvela)
Low-protein. Mix 500 g = £6.82

Loprofin® (SHS)
Low-protein. Mix, plain 500 g = £7.09; chocolate 500 g = £7.50; lemon 500 g = £7.50. Egg replacer 2 × 250 g = £13.03. Egg-white replacer 100 g = £8.38

PK Foods® (Gluten Free Foods Ltd)
Low-protein. Flour mix 750 g = £9.91. Egg replacer 350 g = £4.67

Pasta

Loprofin® (SHS)
Low-protein. Pasta, animal shapes 500 g = £7.13; conchigle 500 g = £7.15; spirals 500 g = £7.42; gnoccetti sardi 500 g = £7.15; lasagne 250 g = £3.61; macaroni elbows 250 g = £3.56; penne 500 g = £7.42; spaghetti 500 g = £7.42; tagliatelle 250 g = £3.56; vermicelli 250 g = £3.69. Rice, imitation 500 g = £7.20

Promin® (Firstplay Dietary)
Low-protein. Pasta, alphabet shapes 500 g = £6.48; lasagne sheets 200 g = £2.76; macaroni 500 g = £6.48; noodles, flat 500 g = £6.48; shells 500 g = £6.48; spaghetti, short-cut 500 g = £6.48; spirals 500 g = £6.48. Rice, imitation 500 g = £6.48. Tricolour pasta, alphabet shapes 500 g = £6.48; shells 500 g = £6.48; spirals 500 g = £6.48.

Pizza bases

Juvela® (Juvela)
Low-protein. Pizza base 2 × 180 g = £7.55

Ultra PKU® (Ultrapharm)
Low-protein. Pizza base 5 × 80 g = £2.45

Savoury meals and mixes

Loprofin® (SHS)
Low-protein. Snack pot, curry 47 g = £3.94

Promin® (Firstplay Dietary)
Low-protein. Burger mix 2 × 62 g = £5.77; lamb & mint 2 × 62 g = £5.77. Couscous 500 g = £6.48. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £7.54. Pasta meal 500 g = £6.48. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £7.54. Pasta spirals in Moroccan sauce 4 × 72 g = £7.54. Sausage mix, apple & sage 4 × 30 g = £6.49; original 4 × 30 g = £6.49; tomato & basil 4 × 30 g = £6.49

Spreads

Taranis® (Firstplay Dietary)
Low-protein. Spread, hazelnut 230 g = £6.80

A7.7 Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

GA1 Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years

GA Gel® (Vitaflo)

Gel, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 8.4 g, carbohydrate 8.6 g, fat trace, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 925), net price 30 × 20-g sachets = £149.04

Nutritional supplement for dietary management of type 1 glutaric aciduria in children 1–10 years

[1]XLYS, Low TRY, Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of type 1 glutaric aciduria

XLYS, TRY Glutaridon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 2 × 500 g = £312.84

Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements

Glucogen storage disease

Corn flour and corn starch

For hypoglycaemia associated with glycogen-storage disease

Glucose
(Dextrose monohydrate)

Net price 500 g = £1.18.

For glycogen storage disease and sucrose/isomaltose intolerance

Glycosade® (Vitaflo)

Powder, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £92.03

Nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for children under 2 years

Homocystinuria or hypermethioninaemia

HCU Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3,5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven vitamin B_6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

HCU cooler® (Vitaflo)

Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £277.20

A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria

HCU Express® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 925), net price 30 × 25-g sachets = £271.88

A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria

HCU gel® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 8.4 g, carbohydrate 8.6 g, fat 30 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals and trace elements. Unflavoured (flavouring: see *FlavourPac®*, p. 925), net price 30 × 20-g sachets = £151.93

A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria

HCU LV® (SHS)

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925) or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £434.40

A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B_6 non-responsive homocystinuria in patients over 8 years.

XMET Homidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour system*, p. 925), net price 500 g = £156.42

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults

[1]XMET Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 25 g,, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour Sytem*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

[2]XMET Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £132.36

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

Hyperlysinamia

HYPER LYS Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years

2. Maxamum products are generally intended for use in children over 8 years and adults

[1]**XLYS Maxamaid** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of hyperlysinaemia

Isovaleric acidaemia

IVA Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years

XLEU Faladon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 200 g = £62.55

Nutritional supplement for the dietary management of isovaleric acidaemia

[1]**XLEU Maxamaid** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of isovaleric acidaemia

Maple syrup urine disease

Isoleucine Amino Acid Supplement (Vitaflo)

Powder, isoleucine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

MSUD Aid III® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £156.42

Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

MSUD Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

MSUD Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 30 × 29-g sachets = £166.73.

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Orange flavour, net price 125-mL carton = £7.58

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 925), net price 30 × 25-g sachets = £271.88.

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

MSUD cooler® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL = £277.20

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

MSUD Gel® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 925), net price 30 × 20-g sachets = £151.93.

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

[1]**MSUD Maxamaid®** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of maple syrup urine disease

[2]**MSUD Maxamum®** (SHS)

Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £132.36

Nutritional supplement for the dietary management of maple syrup urine disease

Valine Amino Acid Supplement (Vitaflo)

Powder, valine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48

Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

1. Maxamaid products are generally intended for use in children 1–8 years

2. Maxamum products are generally intended for use in children over 8 years and adults

Methylmalonic or propionic acidaemia

MMA/PA Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years

XMTVI Asadon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 200 g = £62.55

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults

[1]XMTVI Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

[2]XMTVI Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £132.36

Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

Other inborn errors of metabolism

Cystine Amino Acid Supplement (Vitaflo)

Powder, cystine 500 mg, carbohydrate 3.4 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

DocOmega® (Vitaflo)

Powder, protein (cows' milk, soya protein) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 × 4-g sachets = £32.20

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth

EAA® Supplement (Vitaflo)

Powder, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £174.48

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

KeyOmega® (Vitaflo)

Powder, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 × 4-g sachet = £32.92

A nutritional supplement for the dietary management of inborn errors of metabolism

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

Leucine Amino Acid Supplement (Vitaflo)

Powder, leucine 100 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year and adults

Low protein drink (Milupa)

Powder, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £7.76 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

Note Termed *Milupa® lp-drink* by manufacturer

Phenylalanine Amino Acid Supplement (Vitaflo)

Powder, phenylalanine 50 mg, carbohydrate 3.8 g, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £43.18

Nutritional supplement for use in the dietary management of inborn errors of metabolism only

ProZero® (Vitaflo)

Liquid, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 x 250 mL = £22.50; 6 x 1 litre = £30.00

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

Phenylketonuria

Add-Ins® (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 60 × 18.2-g sachets = £315.60.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

Easiphen® (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Forest berries flavour, net price 250-mL carton = £8.11.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

Lophlex® (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy[3] 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 × 27.8-g sachets = £243.60

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

Loprofin® PKU Drink (SHS)

Liquid, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 61p.

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

Milupa PKU 2-prima® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £131.68

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

3. Nutritional values vary with flavour—consult product literature

Milupa PKU 2-secunda® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62

Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years

Milupa PKU 3-advanta® (Milupa)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62

Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over

Phlexy-10® Exchange System (SHS)

Capsules, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule. Net price 200-cap pack = £35.77

Tablets, protein equivalent (essential and non-essential amino acids except phenylalanine), 833 mg/tablet. Net price 75-tab pack = £23.17

Drink Mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour. Net price 30 × 20-g sachet = £107.86

Nutritional supplement for the dietary management of phenylketonuria

Phlexy-Vits® (SHS)

Powder, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £60.00

Tablets, vitamins, minerals, and trace elements, net price 180-tab pack = £68.26

For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

PK Aid-4® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £120.24 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of phenylketonuria in children and adults

PKU Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £29.72 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

PKU Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Chocolate, pineapple-vanilla. Unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £106.20

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £4.72

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

PKU cooler10® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 87 mL = £112.80.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU cooler15® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 130 mL = £168.00.

Nutritional supplement for the dietary management of phenylketonuria, not recommended for children under 3 years

PKU cooler20® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 174 mL = £225.60.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 3.8 g, energy 315 kJ (76 kcal)/25-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical or unflavoured (flavouring: see *Flavour Pac®*, p. 925), net price 30 x 25-g sachets = £164.84.

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 8 years

PKU gel® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20-g sachet with vitamins, minerals and trace elements. Orange, raspberry, or unflavoured (flavouring: see *Flavour Pac®*, p. 925), net price 30 × 20-g sachets = £95.03.

Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria in children 1–10 years.

PKU Lophlex® LQ 10 (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 170 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.35

Nutritional supplement for dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® LQ 20 (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 3 × 125 mL = £26.04

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Start® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £5.58

Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

Sno-Pro® (SHS)

Liquid, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL= £1.05p

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure, and other inborn errors of amino acid metabolism

L-Tyrosine (SHS)

Powder, net price 100 g = £18.41

For use as a supplement in maternal phenylketonurics who have low plasma tyrosine concentrations

Tyrosine Amino Acid Supplement (Vitaflo)

Powder, tyrosine 1 g, carbohydrate 2.9 g, energy 62 kJ (15 kcal)/4-g sachet, net price 30 × 4-g sachets = £4.08.

Nutritional supplement for the dietary management of phenylketonuria and other inborn errors of amino acid metabolism

[1]XP Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul® Flavour System*, p. 925), net price 500 g = £48.85

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

[2]XP Maxamum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavouring: see *Modjul® Flavour System*, p. 925). Net price 30 × 50-g sachets = £226.50, 500 g = £75.54

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults

Tyrosinaemia

Methionine-free TYR Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

TYR Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

TYR Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 x 29-g sachets = £173.32

Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

TYR Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements. Orange flavour, net price 36 × 125-mL bottle = £272.79

Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

TYR cooler® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 x 130-mL pouch = £277.20

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults

TYR express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac®* sachets, p. 925), net price 30 × 25-g sachets = £271.88

Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

TYR Gel® (Vitaflo)

Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals and trace elements. Unflavoured (flavouring: see *Flavourpac®* sachets, p. 925), net price 30 × 20-g sachets = £151.93

Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

[1]XPHEN TYR Maxamaid (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925). Net price 500 g = £82.57

Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

XPHEN TYR Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925). Net price 500 g = £156.42

Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

XPTM Tyrosidon (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 925). Net price 500 g = £156.42

Nutritional supplement for the dietary management of tyrosinaemia type 1 in children and adults where plasma-methionine concentrations are above normal

Urea cycle disorders (other than arginase deficiency)

L-Arginine (SHS)

Powder, net price 100 g = £12.27

Nutritional supplement for the dietary management of urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase

Conditions for which ACBS products can be prescribed

Birthmarks See Disfiguring skin lesions, below

Dermatitis *Aveeno®* Bath Oil; *Aveeno®* Cream; *Aveeno®* Colloidal; *Aveeno®* Lotion; *E45®* Emollient Bath Oil; *E45®* Emollient Wash Cream; *E45®* Lotion

For details of preparations see section 13.2.1, p. 701

Dermatitis herpetiformis See also Gluten-free foods, p. 925

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo) *Covermark®* classic foundation and finishing powder; *Dermacolor®* Camouflage cream and fixing powder; *Keromask®* masking cream and finishing powder; *Veil®* Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

For details of preparations see section 13.8.2, p. 732

Disinfectants (antiseptics) May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygenic purposes.

Dry mouth (xerostomia) For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

AS Saliva Orthana®; *Biotène Oralbalance®*; *BioXtra®*; *Glandosane®*; *Saliveze®*; *Salivix®*.

For details of preparations see section 12.3.5, p. 698

Eczema See Dermatitis, above

Photodermatoses (skin protection in) *Delph®* Sun Lotion SPF 30; *Sunsense®* Ultra; *Uvistat®* Lipscreen SPF 50, *Uvistat®* Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 730

Pruritus See Dermatitis, above

Wound dressings The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process.
The principal stages of healing are:

- cleansing, removal of debris;
- granulation, vascularisation;
- epithelialisation.

The ideal dressing for moist wound healing needs to ensure that the wound remains:

- moist with exudate, but not macerated;
- free of clinical infection and excessive slough;
- free of toxic chemicals, particles or fibres;
- at the optimum temperature for healing;
- undisturbed by the need for frequent changes;
- at the optimum pH value.

As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings, (section A8.2) are designed to control the environment for wound healing, for example to donate fluid (**hydrogels**), maintain hydration (**hydrocolloids**), or to absorb wound exudate (**alginates, foams**).

Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see *Buyers' Guide: Advanced wound dressings* (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

A8.1 Basic wound contact dressings

A8.1.1 Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to

Wound contact material for different types of wounds

Low Exudate	Moderate Exudate	Heavy Exudate
Wound PINK (Epithelialising)		
Low adherence A8.1.1 Vapour-permeable film A8.2.2 Soft polymer A.8.2.3 Hydrocolloid A8.2.4	Soft polymer A8.2.3 Foam, low absorbent A8.2.5 Alginate A8.2.6	
Wound RED (Granulating) Symptoms or signs of infection, see **Wounds with signs of infection**		
Low adherence A8.1.1 Soft polymer A8.2.3 Hydrocolloid A8.2.4 Foam, low absorbent A8.2.5	Hydrocolloid-fibrous A8.2.4 Foam A8.2.5 Alginate A8.2.6	Foam with extra absorbency A8.2.5 Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6
Wound YELLOW (Sloughy) Symptoms or signs of infection, see **Wounds with signs of infection**		
Hydrogel A8.2.1 Hydrocolloid A8.2.4	Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6	Hydrocolloid-fibrous A8.2.4 Alginate A8.2.6 Capillary-action A8.2.7
Wound BLACK (Necrotic/Eschar) Consider mechanical debridement alongside autolytic debridement		
Hydrogel A8.2.1 Hydrocolloid A8.2.4	Hydrocolloid A8.2.4 Hydrocolloid-fibrous A8.2.4 Foam A8.2.5	Seek advice from wound care specialist
Wounds with signs of infection **Consider systemic antibacterials if appropriate;** also consider odour-absorbent dressings (section A8.2.8) For malodourous wounds with slough or necrotic tissue, consider mechanical or autolytic debridement		
Low adherence with honey A8.3.1 Low adherence with iodine A8.3.2 Low adherence with silver A8.3.3 Hydrocolloid with silver A8.3.3 Honey—topical A8.3.1	Hydrocolloid-fibrous with silver A8.3.3 Foam with silver A8.3.3 Alginate with silver A8.3.3 Honey—topical A8.3.1 Cadexomer–iodine A8.3.2	Hydrocolloid-fibrous with silver A8.3.3 Foam, extra absorbent, with silver A8.3.3 Alginate with honey A8.3.1 Alginate with silver A8.3.3

Note In each section of this table the dressings are listed in order of increasing absorbency.
Some wound contact (primary) dressings require a secondary dressing

interfere with absorption; dressings with 'normal loading' (such as *Jelonet®*) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted Viscose Primary Dressing, BP 1993

Warp knitted fabric manufactured from a bright viscose monofilament.

N-A Dressing®, 9.5 cm × 9.5 cm = 35p, 9.5 cm × 19 cm = 67p (Systagenix)

N-A Ultra® (silicone-coated), 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 63p (Systagenix)

Profore®, 14 cm × 20 cm = 30p (S&N Hlth.)

Tricotex®, 9.5 cm × 9.5 cm = 32p (S&N Hlth.)

Paraffin Gauze Dressing, BP 1993

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—*Paranet®* (light loading); BSN Medical—*Cuticell® Classic* (normal loading); S&N Hlth.—*Jelonet®* (normal loading); Neomedic—*Neotulle®* (normal loading); C D Medical—*Paragauze®* (normal loading))

Atrauman® (Hartmann)

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 24p, 7.5 cm × 10 cm = 26, 10 cm × 20 cm = 58, 20 cm × 30 cm = £1.58

A8.1.2 Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are **not** appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

For lightly exuding wounds

Absorbent Perforated Dressing with Adhesive Border

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cosmopor E®, 5 cm × 7.2 cm = 8p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 26p, 10 cm × 20 cm = 42p, 10 cm × 25 cm = 52p, 10 cm × 35 cm = 72p (Hartmann)

Cutiplast® Steril, 5 cm × 7.2 cm = 5p, 8 cm × 10 cm = 10p, 8 cm × 15 cm = 23p, 10 cm × 20 cm = 29p, 10 cm × 25 cm = 30p, 10 cm × 30 cm = 40p (S&N Hlth.)

Leukomed®, 7.2 cm × 5 cm = 8p, 8 cm × 10 cm = 17p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 45p, 10 cm × 30 cm = 58p, 10 cm × 35 cm = 67p (BSN Medical)

Medipore® + Pad, 5 cm × 7.2 cm = 7p, 10 cm × 10 cm = 15p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 62p (3M)

Medisafe®, 6 cm × 8 cm = 8p, 8 cm × 10 cm = 13p, 8 cm × 12 cm = 23p, 9 cm × 15 cm = 29p, 9 cm × 20 cm = 34p, 9 cm × 25 cm = 36p (Neomedic)

Mepore®, 7 cm × 8 cm = 10p, 10 cm × 11 cm = 21p, 11 cm × 15 cm = 34p, 9 cm × 20 cm = 42p, 9 cm × 25 cm = 58p, 9 cm × 30 cm = 67p, 9 cm × 35 cm = 73p (Mölnlycke)

PremierPore®, 5 cm × 7 cm = 5p, 10 cm × 10 cm = 12p, 10 cm × 15 cm = 18p, 10 cm × 20 cm = 32p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 45p, 10 cm × 35 cm = 52p (Shermond)

Primapore®, 6 cm × 8.3 cm = 17p, 8 cm × 10 cm = 18p, 8 cm × 15 cm = 31p, 10 cm × 20 cm = 41p, 10 cm × 25 cm = 47p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 91p (S&N Hlth)

Softpore®, 6 cm × 7 cm = 6p, 10 cm × 10 cm = 13p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 40p, 10 cm × 30 cm = 49p, 10 cm × 35 cm = 58p (Richardson)

Sterifix®, 5 cm × 7 cm = 18p, 7 cm × 10 cm = 30p, 10 cm × 14 cm = 54p (Hartmann)

Telfa® Island, 5 cm × 10 cm = 8p, 10 cm × 12.5 cm = 27p, 10 cm × 20 cm = 35p, 10 cm × 25.5 cm = 44p, 10 cm × 35 cm = 61p (Covidien)

Absorbent Perforated Plastic Film Faced Dressing

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing. Where no size specified by the prescriber, the 5 cm size to be supplied

Askina® Pad, 5 cm × 5 cm = 13p, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 40p (Braun)

Cutisorb® LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)

Interpose®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)

Melolin®, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 26p, 20 cm × 10 cm = 51p (S&N Hlth)

Release®, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 44p (Systagenix)

Skintact®, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)

Solvaline N®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 17p, 10 cm × 20 cm = 33p (Activa)

Telfa®, 5 cm × 7.5 cm = 12p, 10 cm × 7.5 cm = 15p, 15 cm × 7.5 cm = 17p, 20 cm × 7.5 cm = 29p (Covidien)

For moderately to heavily exuding wounds

Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclypse®, 15 cm × 15 cm = 97p, 20 cm × 30 cm = £2.14, 60 cm × 40 cm = £8.15, 80 cm × 50 cm = £9.35, 60 cm × 70 cm (boot-shape) = £13.54 (Advancis)

Exu-Dry®, 10 cm × 15 cm = £1.06, 15 cm × 23 cm = £2.17, 23 cm × 38 cm = £5.04 (S&N Hlth.)

Mesorb®, cellulose wadding pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = 59p, 10 cm × 15 cm = 77p, 10 cm × 20 cm = 95p, 15 cm × 20 cm = £1.36, 20 cm × 25 cm = £2.14, 20 cm × 30 cm = £2.43 (Mölnlycke)

Telfa Max®, 22.8 cm × 38 cm = £4.62, 38 cm × 45.7 cm = £5.61, 38 cm × 60.9 cm = £8.16 (Covidien)

Zetuvit® E, *non-sterile*, 10 cm × 10 cm = 6p, 10 cm × 20 cm = 8p, 20 cm × 20 cm = 13p, 20 cm × 40 cm = 26p; *sterile*, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 23p, 20 cm × 20 cm = 37p, 20 cm × 40 cm = £1.02(Hartmann)

For heavily exuding wounds

Cutisorb® Ultra (BSN Medical)

Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.99, 20 cm × 20 cm = £6.25, 10 cm × 20 cm = £3.33, 20 cm × 30 cm = £9.42

DryMax® Extra (Aspen Medical)

Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.99, 20 cm × 20 cm = £6.16, 10 cm × 20 cm = £3.28, 20 cm × 30 cm = £8.86

KerraMax® (Ark Therapeutics)

Super absorbent polyacrylate primary dressing, 10 cm × 10 cm = 90p, 10 cm × 22 cm = £1.19, 20 cm × 22 cm = £2.10, 20 cm × 30 cm = £2.40

Zetuvit® Plus (Hartmann)

Super absorbent cellulose primary dressing, 10 cm × 10 cm = 60p, 10 cm × 20 cm = 83p, 15 cm × 20 cm = 95p, 20 cm × 25 cm = £1.30, 20 cm × 40 cm = £2.00

Proguide® WCL (S&N Hlth.)

Super absorbent hydrocellular primary dressing, 10 cm × 10 cm = £2.05

A8.2 Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A8.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

A8.2.1 Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel sheet dressings

ActiFormCool® (Activa)

Hydrogel dressing, 5 cm × 6.5 cm = £1.70, 10 cm × 10 cm = £2.49, 20 cm × 20 cm = £7.51, 10 cm × 15 cm = £3.58

Aquaflo® (Covidien)

Hydrogel dressing, 7.5 cm diameter = £2.55, 12 cm diameter = £5.26

Gel FX® (Synergy Healthcare)

Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 15 cm × 15 cm = £3.20

Geliperm® (Geistlich)

Hydrogel sheets, 10 cm × 10 cm = £2.45

Hydrosorb® (Hartmann)

Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film, 5 cm × 7.5 cm = £1.46; 10 cm × 10 cm = £2.09; 20 cm × 20 cm = £6.26

Hydrosorb® Comfort (with adhesive border, waterproof), 4.5 cm × 6.5 cm = £1.73; 7.5 cm × 10 cm = £2.29; 12.5 cm × 12.5 cm = £3.34

Intrasite Conformable® (S&N Hlth.)

Soft non-woven dressing impregnated with *Intrasite®* gel, 10 cm × 10 cm = £1.70; 10 cm × 20 cm = £2.30; 10 cm × 40 cm = £4.10

Novogel® (Ford)

Glycerol-based hydrogel sheets, 10 cm × 10 cm = £3.07; 30 cm × 30 cm, *standard* = £13.00, *thin* = £12.27; 5 cm × 7.5 cm = £1.95; 15 cm × 20 cm = £5.86; 20 cm × 40 cm = £11.16; 7.5 cm diameter = £2.79

Vacunet® (Protex)

Non-adherent, hydrogel coated polyester net dressing, 10 cm × 10 cm = £1.93, 10 cm × 15 cm = £2.86

Hydrogel application (amorphous)

ActivHeal® Hydrogel (MedLogic)

Hydrogel containing guar gum and propylene glycol, 15 g = £1.39

Aquaform® (Aspen Medical)

Hydrogel containing modified starch copolymer, 8 g = £1.58, 15 g = £1.93

Askina® Gel (Braun)

Hydrogel containing modified starch and glycerol, 15 g = £1.89

Cutimed® (BSN Medical)

Hydrogel, 8 g = £1.56, 15 g = £1.90, 25 g = £2.80

Flexigran® (A1 Pharmaceuticals)

Hydrogel containing starch polymer and glycerol, 15 g = £1.90

GranuGel® (ConvaTec)

Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.19

Intrasite® Gel (S&N Hlth.)

Hydrogel containing modified carmellose polymer and propylene glycol, 8-g sachet = £1.70, 15-g sachet = £2.28, 25-g sachet = £3.38

Nu-Gel® (Systagenix)

Hydrogel containing alginate and propylene glycol, 15 g = £2.09

Purilon® Gel (Coloplast)

Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.64, 15 g = £2.14

A8.2.2 Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

ActivHeal® Film (MedLogic)

Film dressing, 6 cm × 7 cm = 32p, 10 cm × 12.7 cm = 74p, 15 cm × 17.8 cm = £1.81

Askina® Derm (Braun)

Film dressing, 6 cm × 7 cm = 35p, 10 cm × 12 cm = £1.02, 10 cm × 20 cm = £1.94, 15 cm × 20 cm = £2.35, 20 cm × 30 cm = £4.20

Bioclusive® (Systagenix)

Film dressing, 10.2 cm × 12.7 cm = £1.54

C-View® (Aspen Medical)

Film dressing, 6 cm × 7 cm = 38p, 10 cm × 12 cm = £1.02, 12 cm × 12 cm = £1.07, 15 cm × 20 cm = £2.32

Episil® (Advancis)

Film dressing, 12 cm × 12 cm = £1.10, 12 cm × 35 cm = £2.75, 15 cm × 20 cm = £2.10

Hydrofilm® (Hartmann)

Film dressing, 6 cm × 7 cm = 21p, 10 cm × 12.5 cm = 39p, 10 cm × 15 cm = 49p, 10 cm × 25 cm = 76p, 12 cm × 25 cm = 80p, 15 cm × 20 cm = 90p, 20 cm × 30 cm = £1.49

Hypafix® Transparent (BSN Medical)

Film dressing, 10 cm × 2 m = £8.15

Leukomed T® (BSN Medical)

Film dressing, 7.2 cm × 5 cm = 35p, 8 cm × 10 cm = 65p, 10 cm × 12.5 cm = 95p, 11 cm × 14 cm = £1.15, 15 cm × 20 cm = £2.20, 15 cm × 25 cm = £2.35

Mepore® Film (Mölnlycke)

Film dressing, 6 cm × 7 cm = 44p, 10 cm × 12 cm = £1.18, 10 cm × 25 cm = £2.29, 15 cm × 20 cm = £2.91

OpSite® Flexifix (S&N Hlth.)

Film dressing, 5 cm × 1 m = £3.69, 10 cm × 1 m = £6.22; *OpSite® Flexigrid*, 6 cm × 7 cm = 37p, 12 cm × 12 cm = £1.06, 15 cm × 20 cm = £2.69

Polyskin® II (Covidien)

Film dressing, 4 cm × 4 cm = 36p, 5 cm × 7 cm = 39p, 10 cm × 12 cm = £1.01, 10 cm × 20 cm = £2.00, 15 cm × 20 cm = £2.31, 20 cm × 25 cm = £4.03

ProtectFilm® (Wallace Cameron)

Film dressing, 6 cm × 7 cm = 11p, 10 cm × 12 cm = 20p, 15 cm × 20 cm = 40p

Suprasorb F® (Activa)

Film dressing, 5 cm × 7 cm = 31p, 10 cm × 12 cm = 75p, 15 cm × 20 cm = £2.33

Tegaderm® (3M)

Film dressing, 6 cm × 7 cm = 38p, 12 cm × 12 cm = £1.08, 15 cm × 20 cm = £2.34

Vacuskin® (Protex)

Film dressing, 6 cm × 7 cm = 40p, 10 cm × 12 cm = £1.06, 10 cm × 25 cm = £2.06, 15 cm × 20 cm = £2.19

Vapour-permeable Adhesive Film Dressing with absorbent pad

Alldress® (Mölnlycke)

Film dressing, with absorbent pad, 10 cm × 10 cm = 91p, 15 cm × 15 cm = £1.98, 15 cm × 20 cm = £2.44

Clearpore® (Richardson)

Film dressing, with absorbent pad, 6 cm × 7 cm = 12p, 6 cm × 10 cm = 15p, 10 cm × 10 cm = 20p, 15 cm × 10 cm = 24p, 20 cm × 10 cm = 36p, 25 cm × 10 cm = 40p

Hydrofilm® Plus (Hartmann)

Film dressing, with absorbent pad, 5 cm × 7.2 cm = 15p, 9 cm × 10 cm = 20p, 9 cm × 15 cm = 22p, 10 cm × 20 cm = 34p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 53p

Leukomed T® Plus (BSN Medical)

Film dressing, with absorbent pad, 7.2 cm x 5 cm = 25p, 8 cm x 10 cm = 50p, 8 cm x 15 cm = 75p, 10 cm x 20 cm = £1.25, 10 cm x 25 cm = £1.40, 10 cm x 30 cm = £2.35, 10 cm x 35 cm = £2.85

Mepore® (Mölnlycke)

Mepore® Film & Pad, film dressing, with absorbent pad, 4 cm × 5 cm = 23p, 5 cm × 7 cm = 24p, 9 cm × 10 cm = 61p, 9 cm × 15 cm = 90p, 9 cm × 20 cm = £1.31, 9 cm × 25 cm = £1.47, 9 cm × 30 cm = £1.97, 9 cm × 35 cm = £2.45

Mepore® Ultra, film dressing, with absorbent pad, 6 cm × 7 cm = 28p, 7 cm × 8 cm = 39p, 9 cm × 10 cm = 61p, 9 cm × 15 cm = 92p, 9 cm × 20 cm = £1.43, 9 cm × 25 cm = £1.58, 9 cm × 30 cm = £2.61, 10 cm × 11 cm = 75p, 11 cm × 15 cm = £1.12

OpSite® (S&N Hlth.)

OpSite® Plus, film dressing, with absorbent pad, 6.5 cm × 5 cm = 30p, 9.5 cm × 8.5 cm = 83p, 10 cm × 12 cm = £1.13, 10 cm × 20 cm = £1.90, 35 cm × 10 cm = £3.15

OpSite® Post-op, film dressing, with absorbent pad, 8.5 cm × 9.5 cm = 82p, 8.5 cm × 15.5 cm = £1.13, 10 cm × 12 cm = £1.11, 10 cm × 20 cm = £1.86, 10 cm × 25 cm = £2.35, 10 cm × 30 cm = £2.78, 10 cm × 35 cm = £3.09

Pharmapore-PU® (Wallace Cameron)

Film dressing, with absorbent pad, 8.5 cm × 15.5 cm = 20p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 58p

PremierPore VP® (Shermond)

Film dressing, with absorbent pad, 5 cm × 7 cm = 13p, 6 cm × 7 cm = 21p, 10 cm × 10 cm = 16p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 69p

Tegaderm® (3M)

Film dressing, with absorbent pad, 5 cm × 7 cm = 25p, 9 cm × 10 cm = 62p, 9 cm × 15 cm = 92p, 9 cm × 20 cm = £1.34, 9 cm × 25 cm = £1.51, 9 cm × 35 cm = £2.50

Tegaderm® Absorbent Clear, film dressing, with clear acrylic polymer oval-shaped pad, 7.6 cm × 9.5 cm = £2.99, 11.1 cm × 12.7 cm = £3.87, 14.2 cm × 15.8 cm = £5.45; rectangular pad, 14.9 cm × 15.2 cm = £8.26, 20 cm × 20.3 cm = £13.26; 16.8 cm × 19 cm (sacral) = £9.89

For intravenous and subcutaneous catheter sites

Central Gard® (Unomedical)

Vapour–permeable transparent film dressing with adhesive foam border, 16 cm × 7 cm (central venous catheter) = 94p, 16 cm × 8.8 cm (central venous catheter) = £1.03

EasI-V® (ConvaTec)

Vapour–permeable transparent film dressing with adhesive foam border, 7 cm × 7.5 cm (intravenous peripheral cannula) = 38p

IV3000® (S&N Hlth.)

Vapour–permeable, transparent, adhesive film dressing, 5 cm × 6 cm (1-hand) = 40p, 6 cm × 7 cm (non-winged peripheral catheter) = 52p, 7 cm × 9 cm (ported peripheral catheter) = 69p, 9 cm × 12 cm (PICC line) = £1.37, 10 cm × 12 cm (central venous catheter) = £1.32

Mepore® IV (Mölnlycke)

Vapour–permeable, transparent, adhesive film dressing, 5 cm × 5.5 cm = 29p, 8 cm × 9 cm = 38p, 10 cm × 11 cm = 99p

Niko Fix® (Unomedical)

Non-woven fabric dressing with viscose-rayon pad, 7 cm × 8.5 cm (intravenous ported peripheral catheter) = 19p

Pharmapore-PU® IV (Wallace Cameron)

Vapour–permeable, transparent, adhesive film dressing, 8.5 cm × 7 cm = 7p, 6 cm × 7 cm (ported peripheral cannula) = 8p, 7 cm × 9 cm (peripheral cannula, hand) = 17p

Tegaderm® IV (3M)

Vapour–permeable, transparent, adhesive film dressing, 7 cm × 8.5 cm (peripheral catheter) = 57p, 8.5 cm × 10.5 cm (central venous catheter) = £1.11, 10 cm × 15.5 cm (peripherally inserted central venous catheter) = £1.60

A8.2.3 Soft polymer dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes.

Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For *silicone keloid dressings* see section A8.4.2.

Without absorbent pad

Mepitel® (Mölnlycke)

Soft silicone, semi-transparent wound contact dressing, 5 cm × 7 cm = £1.57, 8 cm × 10 cm = £3.13, 12 cm × 15 cm = £6.34, 20 cm × 30 cm = £16.61

Mepitel® One, soft silicone, thin, transparent wound contact dressing, 6 cm × 7 cm = £1.77, 9 cm × 10 cm = £3.32, 13 cm × 15 cm = £6.47, 24 cm × 27.5 cm = £16.60

Physiotulle® (Coloplast)

Non-adherent soft polymer wound contact dressing, 10 cm × 10 cm = £2.13, 15 cm × 20 cm = £6.50

Silon-TSR® (Jobskin)

Soft silicone polymer wound contact dressing, 13 cm × 13 cm = £3.52, 13 cm × 25 cm = £5.47, 28 cm × 30 cm = £7.37

Silflex® (Advancis)

Soft silicone-coated polyester wound contact dressing, 5 cm × 7 cm = £1.25, 8 cm × 10 cm = £2.55, 12 cm × 15 cm = £5.15, 20 cm × 30 cm = £13.25, 35 cm × 60 cm = £39.54

Tegaderm® Contact (3M)

Non-adherent soft polymer wound contact dressing, 7.5 cm × 10 cm = £2.14, 7.5 cm × 20 cm = £4.20, 20 cm × 25 cm = £10.23

Urgotul® (Urgo)

Non-adherent soft polymer wound contact dressing, 5 cm × 5cm = £1.50, 10 cm × 10 cm = £3.00, 10 cm × 40 cm = £10.08, 11 cm × 11 cm = £3.02, 15 cm × 20 cm = £8.49, 16 cm × 21 cm = £8.55, 20 cm × 30 cm = £13.65

With absorbent pad

Allevyn® Gentle (S&N Hlth.)

Soft gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = £1.24, 10 cm × 10 cm = £2.45, 10 cm × 20 cm = £3.94, 15 cm × 15 cm = £4.43, 20 cm × 20 cm = £6.57

Allevyn® Gentle Border, silicone gel wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.44, 10 cm × 10 cm = £2.46, 12.5 cm × 12.5 cm = £3.17, 17.5 cm × 17.5 cm = £6.16, 23 cm × 23.2 cm (heel) = £9.08

Cutimed® Siltec (BSN Medical)

Soft silicone wound contact dressing, with polyurethane foam film backing, 5 cm × 6 cm = £1.23, 10 cm × 10 cm = £2.30, 10 cm × 20 cm = £3.80, 15 cm × 15 cm = £4.30, 20 cm × 20 cm = £6.52, 16 cm × 24 cm (heel) = £6.77; *with adhesive border*, 17.5 cm × 17.5 cm (sacrum) = £4.31

Cutimed® Siltec B, with adhesive border, for lightly to moderately exuding wounds, 7.5 cm × 7.5 cm = £1.43, 12.5 cm × 12.5 cm = £3.03, 15 cm × 15 cm = £4.66, 17.5 cm × 17.5 cm = £4.91

Cutimed® Siltec L, for lightly to moderately exuding wounds, 5 cm × 6 cm = 98p, 10 cm × 10 cm = £1.98, 15 cm × 15 cm = £3.26

Eclypse® Adherent (Advancis)

Soft silicone wound contact layer with absorbent pad and film-backing, 10 cm × 10 cm = £2.99, 10 cm × 20 cm = £3.75, 15 cm × 15 cm = £4.99, 20 cm × 30 cm = £9.99, 17 cm × 19 cm (sacral) = £3.76, 22 cm × 23 cm (sacral) = £6.23

Episil® Absorbent (Advancis)

Soft silicone wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £2.16, 10 cm × 20 cm = £2.90, 10 cm × 30 cm = £4.25, 15 cm × 15 cm = £3.15, 15 cm × 20 cm = £4.10

Flivasorb® (Activa)

Absorbent polymer dressing with non-adherent wound contact layer, 10 cm × 10 cm = £2.12, 20 cm × 20 cm = £6.68, 10 cm × 20 cm = £3.55, 20 cm × 30 cm = £9.45

Mepilex® (Mölnlycke)

Absorbent soft silicone dressing with polyurethane foam film backing, 10 cm × 11 cm = £2.57, 11 cm × 20 cm = £4.24, 15 cm × 16 cm = £4.66, 20 cm × 21 cm = £7.03, 20 cm × 50 cm = £27.44, 13 cm × 20 cm (heel) = £5.22, 15 cm × 22 cm (heel) = £5.94

Mepilex® Border, absorbent soft silicone dressing with polyurethane foam and adhesive border, 7 cm × 7.5 cm = £1.33, 10 cm × 12.5 cm = £2.63, 10 cm × 20 cm = £3.56, 10 cm × 30 cm = £5.36, 15 cm × 17.5 cm = £4.53, 17 cm × 20 cm = £5.87, 18 cm × 18 cm (sacrum) = £4.69, 23 cm × 23 cm (sacrum) = £7.64

Mepilex® Border Lite, thin absorbent soft silicone dressing with polyurethane foam and adhesive border, 4 cm × 5 cm = 91p, 7.5 cm × 7.5 cm = £1.37, 5 cm × 12.5 cm = £1.98, 10 cm × 10 cm = £2.49, 15 cm × 15 cm = £4.06

Mepilex® Lite, thin absorbent soft silicone dressing with polyurethane foam, 6 cm × 8.5 cm = £1.74, 10 cm × 10 cm = £2.08, 15 cm × 15 cm = £4.03, 20 cm × 50 cm = £25.46

Mepilex® Transfer, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.13, 10 cm × 12 cm = £3.35, 15 cm × 20 cm = £10.16, 20 cm × 50 cm = £25.97

Sorbion® Sana (H&R)

Non-adherent polyethylene wound contact dressing with absorbent core, 8.5 cm × 8.5 cm = £5.00, 12 cm × 12 cm = £6.78, 12 cm × 22 cm = £12.56, 22 cm × 22 cm = £20.14

Urgotul® Duo (Urgo)

Non-adherent, soft polymer wound contact dressing with absorbent pad, 5 cm × 10 cm = £2.33, 10 cm × 12 cm = £3.61, 15 cm × 20 cm = £8.38

Urgotul® Duo Border, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8 cm × 8 cm = £2.27, 10 cm × 12 cm = £3.52, 15 cm × 20 cm = £8.17

Bio-cellulose dressings

Sorbion® S (H&R)

Absorbent polymers in cellulose matrix, hypoallergenic fleece envelope (for moderately to heavily exuding wounds), 7.5 cm × 7.5 cm = £1.75, 10 cm × 10 cm = £2.22, 10 cm × 10 cm (drainage) = £2.64, 20 cm × 20 cm = £6.90, 20 cm × 10 cm = £3.68, 30 cm × 10 cm = £5.29, 30 cm × 20 cm = £9.92, 12 cm × 5 cm = £1.86

Suprasorb® X (Activa)

Biosynthetic cellulose fibre dressing (for lightly to moderately exuding wounds), 5 cm × 5 cm = £1.90, 9 cm × 9 cm = £3.95, 14 cm × 20 cm = £7.83; 2 cm × 21 cm (rope) = £6.08

A8.2.4 Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation.

Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Without adhesive border

ActivHeal® Hydrocolloid (MedLogic)

Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 7.5 cm = 76p, 10 cm × 10 cm = £1.55, 15 cm × 15 cm = £3.37, 15 cm × 18 cm (sacral) = £3.91; *with polyurethane foam layer*, 5 cm × 7.5 cm = 96p, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £2.86, 15 cm × 18 cm (sacral) = £3.30

Alione® (Coloplast)

Semi–permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £3.01, 12.5 cm × 12.5 cm = £4.14, 12 cm × 20 cm = £5.44, 15 cm × 15 cm = £5.24, 20 cm × 20 cm = £7.82

Askina® Biofilm Transparent (Braun)

Semi-permeable, polyurethane film dressing with hydrocolloid adhesive, 10 cm × 10 cm = £1.02, 15 cm × 15 cm = £2.31, 20 cm × 20 cm = £3.02

Comfeel® Plus (Coloplast)

Hydrocolloid dressings containing carmellose sodium and calcium alginate. *contour*, 6 cm × 8 cm = £2.08, 9 cm × 11 cm = £3.61; *ulcer*, 4 cm × 6 cm = 90p, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.91, 18 cm × 20 cm (triangular) = £5.35, 20 cm × 20 cm = £7.08; *transparent*, 5 cm × 7 cm = 63p, 5 cm × 15 cm = £1.48, 5 cm × 25 cm = £2.41, 9 cm × 14 cm = £2.28, 9 cm × 25 cm = £3.24, 10 cm × 10 cm = £1.20, 15 cm × 15 cm = £3.12, 15 cm × 20 cm = £3.17, 20 cm × 20 cm = £3.19; *pressure relieving*, 7 cm diameter = £3.24, 10 cm diameter = £4.34, 15 cm diameter = £6.54

DuoDERM® Extra Thin (ConvaTec)

Semi-permeable hydrocolloid dressing, 5 cm × 10 cm = 71p, 7.5 cm × 7.5 cm = 75p, 10 cm × 10 cm = £1.24, 9 cm × 15 cm = £1.66, 9 cm × 25 cm = £2.66, 9 cm × 35 cm = £3.72, 15 cm × 15 cm = £2.68

DuoDERM® Signal, hydrocolloid dressing with 'Time to change' indicator, 10 cm × 10 cm = £1.98, 14 cm × 14 cm = £3.48, 20 cm × 20 cm = £6.91, 11 cm × 19 cm (oval) = £3.01, 18.5 cm × 19.5 cm (heel) = £4.86, 22.5 cm × 20 cm (sacral) = £5.68

Flexigran® (A1 Pharmaceuticals)

Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.19; *thin*, 10 cm × 10 cm = £1.08

Granuflex® (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 10 cm × 10 cm = £2.64, 15 cm × 15 cm = £5.00, 15 cm × 20 cm = £5.42, 20 cm × 20 cm = £7.52

Hydrocoll® Basic (Hartmann)

Hydrocolloid dressing with absorbent wound contact pad, 10 cm × 10 cm = £2.28; *thin*, 7.5 cm × 7.5 cm = 65p, 10 cm × 10 cm = £1.07, 15 cm × 15 cm = £2.42

NU DERM® (Systagenix)

Semi-permeable hydrocolloid dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.56, 15 cm × 15 cm = £3.18, 20 cm × 20 cm = £6.36, 8 cm × 12 cm (heel/elbow) = £3.18, 15 cm × 18 cm (sacral) = £4.45; *thin*, 10 cm × 10 cm = £1.06

Tegaderm® Hydrocolloid (3M)

Hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.30, 15 cm × 15 cm = £4.46; *thin*, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 10 cm = £1.51

Ultec Pro® (Covidien)

Semi-permeable hydrocolloid dressing; without adhesive border 10 cm × 10 cm = £2.23, 15 cm × 15 cm = £4.36, 20 cm × 20 cm = £6.56

With adhesive border

Alione® (Coloplast)

Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £3.01, 12.5 cm × 12.5 cm = £4.14, 12 cm × 20 cm = £5.44, 15 cm × 15 cm = £5.24, 20 cm × 20 cm = £7.82

Granuflex® Bordered (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 6 cm × 6 cm = £1.66, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £5.99, 10 cm × 13 cm (triangular) = £3.71, 15 cm × 18 cm (triangular) = £5.78

Hydrocoll® Border (Hartmann)

Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 5 cm × 5 cm = 94p, 7.5 cm × 7.5 cm = £1.54, 10 cm × 10 cm = £2.25, 15 cm × 15 cm = £4.22; 8 cm × 12 cm (concave) = £1.98; 12 cm × 18 cm (sacral) = £3.36

Tegaderm® Hydrocolloid (3M)

Hydrocolloid dressing with adhesive border, 10 cm × 12 cm (oval) = £2.26, 13 cm × 15 cm (oval) = £4.22; 17.1 cm × 16.1 cm (sacral) = £4.71; *thin*, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 12 cm (oval) = £1.50; 13 cm × 15 cm (oval) = £2.81

Ultec Pro® (Covidien)

Semi-permeable hydrocolloid dressing with adhesive border, 21 cm × 21 cm = £4.58, 15 cm × 18 cm (sacral) = £3.23, 19.5 cm × 23 cm (sacral) = £4.88

Hydrocolloid-fibrous dressings

Aquacel® (ConvaTec)

Soft non-woven pad containing hydrocolloid-fibres, 4 cm × 10 cm = £1.40, 4 cm × 20 cm = £2.07, 4 cm × 30 cm = £3.11, 5 cm × 5 cm = £1.10; 10 cm × 10 cm = £2.61; 15 cm × 15 cm = £4.91; 2 cm × 45 cm (ribbon) = £2.64

Versiva® XC (ConvaTec)

Hydrocolloid gelling foam dressing, without adhesive border, 7.5 cm × 7.5 cm = £1.39, 11 cm × 11 cm = £2.31, 15 cm × 15 cm = £4.26, 20 cm × 20 cm = £6.37; *with adhesive border*, 10 cm × 10 cm = £2.36, 14 cm × 14 cm = £3.19, 19 cm × 19 cm = £5.09, 22 cm × 22 cm = £5.65, 18.5 cm × 20.5 cm (heel) = £5.65, 21 cm × 25 cm (sacral) = £6.06

Polyurethane matrix dressing

Cutinova® Hydro (S&N Hlth.)

Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm × 6 cm = £1.19, 10 cm × 10 cm = £2.40, 15 cm × 20 cm = £5.07

A8.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant on the level of exudate

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handing capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin.

For lightly exuding wounds

Polyurethane Foam Film Dressing with Adhesive Border

PolyMem®, 5 cm × 5 cm = 48p (Aspen Medical)

Tielle® Lite, 11 cm × 11 cm = £2.28; 7 cm × 9 cm = £1.21; 8 cm × 15 cm = £2.81; 8 cm × 20 cm = £2.97 (Systagenix)

For lightly to moderately exuding wounds

Polyurethane Foam Dressing, BP 1993

Lyofoam®, 7.5 cm × 7.5 cm = £1.05, 10 cm × 10 cm = £1.20, 10 cm × 17.5 cm = £1.94, 15 cm × 20 cm = £2.61 (Mölnlycke)

Suprasorb® M, 10 cm × 10 cm = £1.78, 10 cm × 20 cm = £3.14, 20 cm × 20 cm = £5.23 (Activa)

Polyurethane Foam Film Dressing with Adhesive Border

Suprasorb® P, 7.5 cm × 7.5 cm = £1.20, 10 cm × 10 cm = £1.29, 15 cm × 15 cm = £2.32 (Activa)

Tielle®, 11 cm × 11 cm = £2.38; 15 cm × 15 cm = £3.89, 18 cm × 18 cm = £4.95, 7 cm × 9 cm = £1.28, 15 cm × 20 cm = £4.87, 18 cm × 18 cm (sacral) = £3.60 (Systagenix)

Polyurethane Foam Film Dressing without Adhesive Border

ActivHeal FlexiPore®, self-adhesive, 6 cm × 7 cm = 94p; 10 cm × 10 cm = £1.74, 15 cm × 20 cm = £3.70; 20 cm × 20 cm = £5.06; 10 cm × 30 cm = £3.63 (MedLogic)

Allevyn® Lite, 5 cm × 5 cm = £1.06; 10 cm × 10 cm = £1.93; 10 cm × 20 cm = £3.31; 15 cm × 20 cm = £4.13 (S&N Hlth.)

Allevyn® Thin, self-adhesive, 5 cm × 6 cm = £1.00, 10 cm × 10 cm = £2.03, 15 cm × 15 cm = £3.35, 15 cm × 20 cm = £4.06 (S&N Hlth)

Suprasorb® P, 5 cm × 5 cm = 93p, 7.5 cm × 7.5 cm = 99p, 10 cm × 10 cm = £1.17, 15 cm × 15 cm = £3.12 (Activa)

Transorbent®, self-adhesive, 5 cm × 7 cm = £1.01; 10 cm × 10 cm = £1.90; 15 cm × 15 cm = £3.50; 20 cm × 20 cm = £5.59 (Braun)

UrgoCell® TLC, soft-adherent, 6 cm × 6 cm = £1.74, 10 cm × 10 cm = £2.53, 15 cm × 20 cm = £5.47, 12 cm × 19 cm (heel) = £4.52 (Urgo)

For moderately to heavily exuding wounds

Polyurethane Foam Dressing

Copa®, 5 cm × 5 cm = 70p, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £1.04, 12.5 cm × 12.5 cm = £1.77, 15 cm × 15 cm = £2.55, 20 cm × 20 cm = £2.95, 10 cm × 20 cm = £2.01, 8.5 cm × 7.5 cm (fenestrated) = 89p (Covidien)

Cutimed® Cavity, 5 cm × 6 cm = £1.74, 10 cm × 10 cm = £2.89, 15 cm × 2 cm = £1.61, 15 cm × 15 cm = £4.34 (BSN Medical)

Polyurethane Foam Film Dressing with Adhesive Border

ActivHeal® Foam Island, 7.5 cm × 7.5 cm = £1.18, 10 cm × 10 cm = £1.60, 12.5 cm × 12.5 cm = £1.68, 15 cm × 15 cm = £2.15, 20 cm × 20 cm = £4.42 (MedLogic)

Advazorb® Border, 6 cm × 10 cm = £1.10, 8 cm × 12 cm = £1.90 (Advancis)

Allevyn® Adhesive, 7.5 cm × 7.5 cm = £1.43, 10 cm × 10 cm = £2.10, 12.5 cm × 12.5 cm = £2.57, 17.5 cm × 17.5 cm = £5.07, 12.5 cm × 22.5 cm = £4.00, 22.5 cm × 22.5 cm = £7.38; (sacral) 17 cm x 17 cm = £3.80, 22 cm x 22 cm = £5.47 (S&N Hlth.)

Allevyn® Plus Adhesive, 12.5 cm × 12.5 cm = £3.16; 17.5 cm × 17.5 cm = £6.10; 12.5 cm × 22.5 cm = £5.60; (sacral) 17 cm x 17 cm = £4.61, 22 cm x 22 cm = £6.67 (S&N Hlth)

Biatain® Adhesive, 10 cm × 10 cm = £1.65 12.5 cm × 12.5 cm = £2.41, 18 cm × 18 cm = £4.86, 18 cm × 28 cm = £7.20, 23 cm × 23 cm (sacral) = £4.16, 19 cm × 20 cm (heel) = £4.85; 17 cm diameter (contour) = £4.67 (Coloplast)

Askina® Foam, 10 cm × 10 cm = £2.06, 10 cm × 20 cm = £3.25, 20 cm × 20 cm = £5.43, 12 cm × 20 cm (heel) = £4.40; cavity dressing, 2.4 cm × 40 cm = £2.30 (Braun)

Biatain® Non-Adhesive, 10 cm × 10 cm = £2.24, 10 cm × 20 cm = £3.70, 15 cm × 15 cm = £4.13, 20 cm × 20 cm = £6.13; 5 cm × 7 cm = £1.23; *Biatain® Soft-Hold*, 10 cm × 10 cm = £2.44, 15 cm × 15 cm = £4.05, 5 cm × 7 cm = £1.22, 10 cm × 20 cm = £3.70 (Coloplast)

Copa® Plus, 5 cm × 5 cm = 80p, 7.5 cm × 7.5 cm = £1.39, 10 cm × 10 cm = £1.44, 15 cm × 15 cm = £3.32, 20 cm × 20 cm = £3.96, 10 cm × 20 cm = £2.64, 8.5 cm × 7.5 cm (fenestrated) = £1.22 (Covidien)

Kerraboot®, (clear or white), foot-shaped, extra small = £14.38, small = £14.66, large = £14.66, extra large = £14.38 (Ark)

Lyofoam® Extra, 10 cm × 10 cm = £2.08, 17.5 cm × 10 cm = £3.52, 20 cm × 15 cm = £4.56 (Medlock)

PermaFoam®, 10 cm × 10 cm = £1.98, 10 cm × 20 cm = £3.39, 15 cm × 15 cm = £3.76, 20 cm × 20 cm = £5.74; 6 cm diameter = £1.02, 8 cm × 8 cm (fenestrated) = £1.17; cavity dressing, 10 cm × 10 cm = £1.85 (Hartmann)

PolyMem®, 8 cm × 8 cm = £1.51, 10 cm × 10 cm = £2.35, 13 cm × 13 cm = £3.93, 17 cm × 19 cm = £5.80, 10 cm × 61 cm = £12.49; *PolyWic*® 8 cm × 8 cm (cavity) = £3.52; *PolyMax*® 11 cm × 11 cm = £2.83 (Aspen Medical)

Tegaderm® Foam, 8.8 cm × 8.8 cm (fenestrated) = £2.14, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.57, 20 cm × 20 cm = £5.69, 10 cm × 60 cm = £12.05 (3M)

Tielle® Plus Borderless, 11 cm × 11 cm = £3.04; 15 cm × 20 cm = £5.51 (Systagenix)

Tielle® Xtra, 11 cm × 11 cm = £2.24; 15 cm × 15 cm = £3.37, 15 cm × 20 cm = £5.51 (Systagenix)

Trufoam® NA, 5 cm × 5 cm = £1.09, 10 cm × 10 cm = £2.07, 15 cm × 15 cm = £3.81 (Aspen Medical)

Cavi-Care® (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.62

A8.2.6 Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of

autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal® (MedLogic)

Activheal® Alginate, calcium sodium alginate dressing, 5 cm × 5 cm = 58p, 10 cm × 10 cm = £1.13, 10 cm × 20 cm = £2.78; cavity dressing, 2 cm × 30 cm = £2.09

ActivHeal Aquafiber®, non-woven, calcium sodium alginate dressing, 5 cm × 5 cm = 74p, 10 cm × 10 cm = £1.77, 15 cm × 15 cm = £3.34; cavity dressing, 2 cm × 42 cm = £1.78

Algisite® M (S&N Hlth.)

Calcium alginate fibre, non-woven dressing, 5 cm × 5 cm = 87p, 10 cm × 10 cm = £1.80, 15 cm × 20 cm = £4.84; cavity dressing, 2 cm × 30 cm = £3.27

Algosteril® (S&N Hlth.)

Calcium alginate dressing. 5 cm × 5 cm = 87p, 10 cm × 10 cm = £1.98, 10 cm × 20 cm = £3.34; cavity dressing, 2 g, 30 cm = £3.57

Curasorb® (Covidien)

Calcium alginate dressing, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.49, 10 cm × 14 cm = £2.41, 10 cm × 20 cm = £2.93, 15 cm × 25 cm = £5.15, 30 cm × 61 cm = £27.03; cavity dressing, 30 cm = £2.84, 61 cm = £4.98, 91 cm = £5.36

Curasorb® Plus, calcium alginate dressing, 10 cm × 10 cm = £2.04

Curasorb® Zn, calcium alginate and zinc dressing, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.30

Kaltostat® (ConvaTec)

Calcium alginate fibre, non-woven, 5 cm × 5 cm, = 90p, 7.5 cm × 12 cm = £1.96, 10 cm × 20 cm = £3.84, 15 cm × 25 cm = £6.61; cavity dressing, 2 g = £3.60

Melgisorb® (Mölnlycke)

Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 86p, 10 cm × 10 cm = £1.79, 10 cm × 20 cm = £3.36; cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.39

SeaSorb® Soft (Coloplast)

Alginate and carboxymethylcellulose dressing, highly absorbent, gelling dressing, 5 cm × 5 cm = 91p, 10 cm × 10 cm = £2.18, 15 cm × 15 cm = £4.13; gelling filler, 44 cm = £2.57

Sorbalgon® (Hartmann)

Calcium alginate dressing, 5 cm × 5 cm = 76p, 10 cm × 10 cm = £1.59; *Sorbalgon® T*, cavity dressing, 2 g, 30 cm = £3.24

Sorbsan® (Aspen Medical)

Sorbsan® Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 79p, 10 cm × 10 cm = £1.66, 10 cm × 20 cm = £3.10

Sorbsan® Plus, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.67, 10 cm × 15 cm = £2.96, 10 cm × 20 cm = £3.77, 15 cm × 20 cm = £5.24

Sorbsan® Plus SA, alginate dressing with adhesive border and absorbent backing, 11.5 cm × 14 cm = £2.92, 14 cm × 19 cm = £4.25, 14 cm × 24 cm = £5.14, 19 cm × 24 cm = £6.45

Sorbsan® Ribbon, 40 cm (with probe) = £2.01

Sorbsan® Surgical Packing, 30 cm (2 g, with probe) = £3.41

Suprasorb® A (Activa)

Calcium alginate dressing, 5 cm × 5 cm = 58p, 10 cm × 10 cm = £1.14; cavity dressing, 30 cm (2 g) = £2.11

Tegaderm® Alginate (3M)

Calcium alginate dressing, 5 cm × 5 cm = 77p, 10 cm × 10 cm = £1.62; cavity dressing, 2 cm × 30.4 cm = £2.70

Urgosorb® (Urgo)

Alginate and carboxymethylcellulose dressing without adhesive border, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.64; cavity dressing, 30 cm = £2.65

A8.2.7 Capillary-action dressings

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

Advadraw® (Advancis)

Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 56p, 10 cm × 10 cm = 87p, 10 cm × 15 cm = £1.17, 15 cm × 20 cm = £1.54

Advadraw Spiral®, 0.5 cm × 40 cm = 81p

Cerdak® Basic (CliniMed)

Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

Cerdak® Aerocloth, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94

Cerdak® Aerofilm, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

Sumar® (Lantor)

Sumar® Lite, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

Sumar® Max, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

Sumar® Spiral, 0.5 cm × 40 cm = £1.57

Vacutex® (Protex)

Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 10 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28

A8.2.8 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

Askina® Carbosorb (Braun)
Activated charcoal and non-woven viscose rayon dressing, 10 cm × 10 cm = £2.72, 10 cm × 20 cm = £5.25

CarboFLEX® (ConvaTec)
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm × 10 cm = £2.98, 8 cm × 15 cm = £3.57, 15 cm × 20 cm = £6.77

Carbopad® VC (Synergy Healthcare)
Activated charcoal non-absorbent dressing, 10 cm × 10 cm = £1.59, 10 cm × 20 cm = £2.15

CliniSorb® Odour Control Dressings (CliniMed)
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating. 10 cm × 10 cm = £1.78, 10 cm × 20 cm = £2.37, 15 cm × 25 cm = £3.81

Lyofoam® C (Medlock)
Lyofoam sheet with layer of activated charcoal cloth and additional outer envelope of polyurethane foam. 10 cm × 10 cm = £2.93, 15 cm × 20 cm = £6.65

Sorbsan® Plus Carbon (Aspen Medical)
Alginate dressing with activated carbon, 7.5 cm × 10 cm = £2.44, 10 cm × 15 cm = £4.73, 10 cm × 20 cm = £5.66, 15 cm × 20 cm = £6.52

A8.3 Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials.

For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

Medical grade honey (section A8.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with **iodine** (section A8.3.2), can be used to treat clinically infected wounds. Dressings containing **silver** (section A8.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other **antimicrobials** (section A8.3.4) such as polihexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

A8.3.1 Honey

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

Sheet dressing

Actilite® (Advancis)
Knitted viscose impregnated with medical grade manuka honey and manuka oil, 10 cm × 10 cm = 95p, 10 cm × 20 cm = £1.85

Activon Tulle® (Advancis)
Knitted viscose impregnated with medical grade manuka honey, 5 cm × 5 cm = £1.78, 10 cm × 10 cm = £3.01
Where no size stated by the prescriber the 5 cm size to be supplied

Algivon® (Advancis)
Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm × 5 cm = £2.09, 10 cm × 10 cm = £3.53

Medihoney® (Medihoney)
Antibacterial Honey Tulle, woven fabric impregnated with medical grade manuka honey, 10 cm × 10 cm = £2.98
Gel sheet, sodium alginate dressing impregnated with medical grade honey, 5 cm × 5 cm = £1.75, 10 cm × 10 cm = £4.20
Antibacterial Honey Apinate®, non-adherent calcium alginate dressing, impregnated with medical grade honey, 10 cm × 10 cm = £5.09

Melladerm® Plus Tulle (Danetre)
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol, 10 cm × 10 cm = £2.10

MelMax® (CliniMed)
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis, 5 cm × 6 cm = £4.82, 8 cm × 10 cm = £9.90, 8 cm × 20 cm = £19.79

Mesitran® (Aspen Medical)
Hydrogel, semi-permeable dressing impregnated with medical grade honey, 10 cm × 10 cm = £2.51, 10 cm × 17.5 cm = £4.52, 15 cm × 20 cm = £5.22; *with adhesive border*, 10 cm × 10 cm = £2.61, 15 cm × 13 cm (sacral) = £4.42, 15 cm × 15 cm = £4.62
Mesitran® Mesh, hydrogel, non-adherent wound contact layer, without adhesive border, 10 cm × 10 cm = £2.41

Honey-based topical application

Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds.

Activon® (Advancis)
Manuka honey, (medical grade), 25-g tube = £1.99

MANUKApli® (Manuka Medical)
Honey, (medical grade, manuka), 15-g tube = £2.95

Medihoney® (Medihoney)
Antibacterial Medical Honey, honey (medical grade, *Leptospermum* sp.), 20-g tube = £3.96, 50-g tube = £9.90
Antibacterial Wound Gel, honey (medical grade, *Leptospermum* sp.), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02
Note *Antibacterial Wound Gel* is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult

Melladerm® Plus (Danetre)

Honey, (medical grade; Bulgarian, mountain flower) 45% in basis containing polyethylene glycol, 20-g tube = £4.49, 50-g tube = £8.50

Mesitran® (Aspen Medical)

Ointment, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55

Excipients include lanolin

Ointment S, honey (medical grade) 40%, 15-g tube = £3.46

Excipients include lanolin

A8.3.2 Iodine

Cadexomer–iodine, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages desloughing.

Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen.

Povidone–iodine fabric dressing is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate.

Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

Iodoflex® (S&N Hlth.)

Paste, iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing, 5-g unit = £3.82; 10 g = £7.62; 17 g = £12.08

Uses for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

Cautions iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

Contra-indications children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

Iodosorb® (S&N Hlth.)

Ointment, iodine 0.9% as cadexomer–iodine in an ointment basis, 10 g = £4.21; 20 g = £8.43

Powder, iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet = £1.80

Uses for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

Cautions iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

Contra-indications children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

Iodozyme® (Insense)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £7.50, 10 cm × 10 cm = £12.50

Uses antimicrobial dressing for lightly to moderately exuding wounds

Cautions children; pregnancy and breast-feeding

Contra-indications thyroid disorders; patients receiving lithium

Oxyzyme® (Insense)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £6.00, 10 cm × 10 cm = £10.00

Uses non-infected, dry to moderately exuding wounds

Cautions children; pregnancy and breast-feeding

Contra-indications thyroid disorders; patients receiving lithium

Povidone–iodine Fabric Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = 32p; 9.5 cm × 9.5 cm = 48p (Systagenix—*Inadine®*)

Uses wound contact layer for abrasions and superficial burns

Cautions iodine may be absorbed particularly if large wounds treated; children under 6 months; thyroid disease

Contra-indications severe renal impairment; pregnancy; breast-feeding

A8.3.3 Silver

Antimicrobial dressings containing **silver** should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 944). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulphonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulphonamides).

Low adherence dressings

Acticoat® (S&N Hlth.)

Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.30, 10 cm × 10 cm = £8.07, 10 cm × 20 cm = £12.62, 20 cm × 40 cm = £43.18

Acticoat® 7 five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.74, 10 cm × 12.5 cm = £17.11, 15 cm × 15 cm = £30.76

Acticoat® Flex 3, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.28, 10 cm × 10 cm = £8.01, 10 cm × 20 cm = £12.52, 20 cm × 40 cm = £42.85

Acticoat® Flex 7, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.70, 15 cm × 15 cm = £30.53, 10 cm × 12.5 cm = £16.98

Atrauman® Ag (Hartmann)

Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 47p, 10 cm × 10 cm = £1.15, 10 cm × 20 cm = £2.25

With charcoal

Actisorb® Silver 220 (Systagenix)

Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.64, 10.5 cm × 10.5 cm = £2.58, 10.5 cm × 19 cm = £4.70

Soft polymer dressings

Allevyn® Ag Gentle (S&N Hlth.)

Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, *with adhesive border*, 7.5 cm × 7.5 cm = £3.99, 10 cm × 10 cm = £5.99, 12.5 cm × 12.5 cm = £7.71, 17.5 cm × 17.5 cm = £14.69; *without adhesive border*, 5 cm × 5 cm = £3.12, 10 cm × 10 cm = £5.82, 10 cm × 20 cm = £9.62, 15 cm × 15 cm = £10.83, 20 cm × 20 cm = £16.04

Contra-indications see notes above

Mepilex® Ag (Mölnlycke)

Soft silicone wound contact dressing with polyurethane foam film backing, with silver, 10 cm × 10 cm = £5.85, 10 cm × 20 cm = £9.64, 15 cm × 15 cm = £10.85, 20 cm × 20 cm = £16.08, 20 cm × 50 cm = £60.17

Urgotul® Silver (Urgo)

Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.34, 15 cm × 20 cm = £9.09

Urgotul® Duo Silver, non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.95, 11 cm × 11 cm = £3.87, 15 cm × 20 cm = £9.35

Urgotul® SSD (Urgo)

Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine, 11 cm × 11 cm = £2.99, 16 cm × 21 cm = £8.48

Contra-indications see notes above

Hydrocolloid dressings

Aquacel® Ag (ConvaTec)

Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.70, 4 cm × 20 cm = £3.52, 4 cm × 30 cm = £5.27, 5 cm × 5 cm = £1.86, 10 cm × 10 cm = £4.44, 15 cm × 15 cm = £8.36, 20 cm × 30 cm = £20.73; 2 cm × 45 cm (ribbon) = £4.46

Biatain® Ag Hydrocolloid (Coloplast)

Semi-permeable, antimicrobial barrier dressing with ionic silver (silver sodium thiosulphate), 10 cm × 10 cm = £6.72, 15 cm × 15 cm = £13.44

Physiotulle® Ag (Coloplast)

Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.14

Contra-indications see notes above

Foam dressings

Acticoat® Moisture Control (S&N Hlth.)

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £6.76, 10 cm × 10 cm = £15.82, 10 cm × 20 cm = £30.82

Allevyn® Ag (S&N Hlth.)

Silver sulfadiazine impregnated polyurethane foam film dressing *with adhesive border*, 7.5 cm × 7.5 cm = £3.24, 10 cm × 10 cm = £5.10, 12.5 cm × 12.5 cm = £6.70, 17.5 cm × 17.5 cm = £12.89, 17 cm × 17 cm (sacral) = £10.06, 22 cm × 22 cm (sacral) = £13.48; *without adhesive border*, 5 cm × 5 cm = £3.02, 10 cm × 10 cm = £5.69, 15 cm × 15 cm = £10.79, 20 cm × 20 cm = £15.81, 10.5 cm × 13.5 cm (heel) = £9.97

Contra-indications see notes above

Biatain® Ag (Coloplast)

Silver impregnated polyurethane foam film dressing *with adhesive border*, 12.5 cm × 12.5 cm = £8.71, 18 cm × 18 cm = £17.47, 19 cm × 20 cm (heel) = £17.23, 23 cm × 23 cm (sacral) = £18.31; *without adhesive border*, 10 cm × 10 cm = £7.61, 5 cm × 7 cm = £3.13, 10 cm × 20 cm = £13.99, 15 cm × 15 cm = £15.28, 20 cm × 20 cm = £21.55; 5 cm × 8 cm (cavity) = £3.79

PolyMem® Silver (Aspen Medical)

Silver impregnated polyurethane foam film dressing, *with adhesive border*, 5 cm × 7.6 cm (oval) = £2.17, 12.7 cm × 8.8 cm (oval) = £5.34; *without adhesive border*, 10.8 cm × 10.8 cm = £8.45, 17 cm × 19 cm = £16.93; 8 cm × 8 cm (cavity) = £6.72

UrgoCell® Silver (Urgo)

Non-adherent, polyurethane foam film dressing with silver in wound contact layer, 6 cm × 6 cm = £4.11, 10 cm × 10 cm = £5.65, 15 cm × 20 cm = £10.17

Alginate dressings

Acticoat® Absorbent (S&N Hlth.)

Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £5.04, 10 cm × 12.5 cm = £12.11; 2 cm × 30 cm (cavity) = £12.18

Algisite® Ag (S&N Hlth.)

Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.85, 10 cm × 20 cm = £7.09; 2 g, 30 cm (cavity) = £5.32

Melgisorb® Ag (Mölnlycke)

Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £1.71, 10 cm × 10 cm = £3.43, 15 cm × 15 cm = £7.25; 3 cm × 44 cm (cavity) = £4.32

Seasorb® Ag (Coloplast)

Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.74, 15 cm × 15 cm = £6.12; 3 cm × 44 cm (cavity) = £4.05

Silvercel® (Systagenix)

Alginate and carboxymethylcellulose dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.45, 5 cm × 5 cm = £1.68, 10 cm × 20 cm = £7.68, 11 cm × 11 cm = £4.14

Silvercel® Non-adherent, alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver, 5 cm × 5 cm = £1.80, 11 cm × 11 cm = £4.32, 10 cm × 20 cm = £8.05; 2.5 cm × 30.5 cm (cavity) = £4.37

Sorbsan® Silver (Aspen Medical)

Sorbsan® Silver Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.91, 10 cm × 20 cm = £7.13

Sorbsan® Silver Plus, calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.25, 10 cm × 15 cm = £5.41, 10 cm × 20 cm = £6.58, 15 cm × 20 cm = £8.82

Sorbsan® Silver Plus SA, calcium alginate dressing with absorbent backing and adhesive border, with silver, 11.5 cm × 14 cm = £5.28, 14 cm × 19 cm = £7.60, 14 cm × 24 cm = £8.36, 19 cm × 24 cm = £9.32

Sorbsan® Silver Ribbon, with silver, 40 cm (with probe) = £4.08

Sorbsan® Silver Surgical Packing, with silver, 30 cm (2 g, with probe) = £5.55

Suprasorb® A + Ag (Activa)

Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.51, 10 cm × 10 cm = £3.80, 10 cm × 20 cm = £7.02; cavity dressing, 30 cm (2 g) = £5.62

Tegaderm® Alginate Ag (3M)

Calcium alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.35, 10 cm × 10 cm = £3.15; cavity dressing 3 cm × 30 cm = £3.60

Urgosorb® Silver (Urgo)

Alginate and carboxymethylcellulose dressing, impregnated with silver, 5 cm × 5 cm = £1.44, 10 cm × 10 cm = £3.44, 10 cm × 20 cm = £6.48; cavity dressing, 2.5 cm × 30 cm = £3.46

A8.3.4 Other antimicrobials

Chlorhexidine Gauze Dressing, BP 1993

Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate, 5 cm × 5 cm = 27p; 10 cm × 10 cm = 57p (S&N Hlth.—*Bactigras®*)

Cutimed® Sorbact (BSN Medical)

Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride, (dressing pad) 7 cm × 9 cm = £3.20, 10 cm × 10 cm = £5.00, 10 cm × 20 cm = £7.80; (swabs) 4 cm ×

6 cm = £1.50, 7 cm × 9 cm = £2.50, (round swabs) 3 cm, 5 pad pack = £3.00; (ribbon gauze, cotton) 2 cm × 50 cm = £3.74, 5 cm × 2 m = £7.37

Gel, hydrogel dressing impregnated with dialkylcarbamoyl chloride, 7.5 cm × 7.5 cm = £2.46, 7.5 cm × 15 cm = £4.15

Flaminal® (Ark Therapeutics)

Forte gel, alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds, 15 g = £7.18, 50 g = £23.77

Hydro gel, alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds, 15 g = £7.18, 50 g = £23.77

Kendall AMD® (Covidien)

Foam dressing with polihexanide, *without adhesive border*, 5 cm × 5 cm = £2.45, 10 cm × 10 cm = £4.62, 15 cm × 15 cm = £8.75, 20 cm × 20 cm = £12.82, 8.8 cm × 7.5 cm (fenestrated) = £4.15, 10 cm × 20 cm = £8.75

Kendall AMD® Plus 10 cm × 10 cm = £4.85, 8.8 cm × 7.5 cm (fenestrated) = £4.35

Octenilin® (Schülke)

Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride, 20 mL = £4.78

Prontosan® Wound Gel (Braun)

Hydrogel containing betaine surfactant and polihexanide, 30 mL = £6.01

Suprasorb® X + PHMB (Activa)

Biosynthetic cellulose fibre dressing with polihexanide, 5 cm × 5 cm = £2.38, 9 cm × 9 cm = £4.73, 14 cm × 20 cm = £10.76; 2 cm × 21 cm (rope) = £6.70

Telfa® AMD (Covidien)

Low adherence absorbent perforated plastic film faced dressing with polihexanide, 7.5 cm × 10 cm = 17p, 7.5 cm × 20 cm = 28p

Telfa® AMD Island, low adherence dressing with adhesive border and absorbent pad, with polihexanide, 10 cm × 12.5 cm = 58p, 10 cm × 20 cm = 85p, 10 cm × 25.5 cm = 96p, 10 cm × 35 cm = £1.19

A8.4 Specialised dressings

A8.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of *proteolytic enzymes* in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Cadesorb® (S&N Hlth.)

Ointment, starch-based, 10 g = £5.10, 20 g = £8.69

Catrix® (Cranage)

Powder, collagen matrix (cartilage, bovine), 1-g sachet = £3.80

Promogran® (Systagenix)

Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm^2 (hexagonal) = £5.19, 123 cm^2 (hexagonal) = £15.62

Promogran® Prisma® Matrix, collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm^2 (hexagonal) = £6.31, 123 cm^2 (hexagonal) = £17.98

Suprasorb® C (Activa)

Collagen, 4 cm × 6 cm = £2.64, 6 cm × 8 cm = £4.04, 8 cm × 12 cm = £7.92

Tegaderm® Matrix (3M)

Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75

UrgoCell® Start TLC (Urgo)

Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing, 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £5.95, 15 cm × 20 cm = £10.70, 12 cm × 19 cm (heel) = £8.20

Urgotul® Start (Urgo)

Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF), 5 cm × 7 cm = £2.80, 11 cm × 11 cm = £3.98, 16 cm × 21 cm = £9.50

Xelma® (Mölnlycke)

Gel, alginate and propylene glycol with extracellular matrix proteins (amelogenins), 0.5-mL syringe = £56.00, 1-mL syringe = £98.00

A8.4.2 Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone sheets

Advasil® Conform (Advancis)

Self-adhesive silicone gel sheet with polyurethane film backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

Cica-Care® (S&N Hlth.)

Soft, self-adhesive, semi-occlusive silicone gel sheet with backing. 6 cm × 12 cm = £13.79; 15 cm × 12 cm = £26.89

Ciltech® (Su-Med)

Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 10 cm × 20 cm = £12.50

Dermatix® (Meda)

Self-adhesive silicone gel sheet (clear- or fabric-backed), 4 cm × 13 cm = £6.61, 13 cm × 13 cm = £15.17, 13 cm × 25 cm = £27.41, 20 cm × 30 cm = £49.92

Mepiform® (Mölnlycke)

Self-adhesive silicone gel sheet with polyurethane film backing, 5 cm × 7 cm = £3.23, 9 cm × 18 cm = £12.62, 4 cm × 31 cm = £10.19

Scar FX® (Jobskin)

Self-adhesive, transparent, silicone gel sheet, 10 cm × 20 cm = £16.00, 25.5 cm × 30.5 cm = £60.00, 3.75 cm × 22.5 cm = £12.00, 7.5 cm diameter = £8.50, 22.5 cm × 14.5 cm = £12.00

Silgel® (Nagor)

Silicone gel sheet, 10 cm × 10 cm = £13.50; 20 cm × 20 cm = £40.00; 40 cm × 40 cm = £144.00; 10 cm × 5 cm = £7.50; 15 cm x 10 cm = £19.50; 30 cm × 5 cm = £19.50; 10 cm × 30 cm = £31.50; 25 cm × 15 cm (submammary) = £21.12; 46 cm × 8.5 cm (abdominal) = £39.46; 5.5 cm diameter (circular) = £4.00

Silicone gel

Ciltech® (Su-Med)

Silicone gel, 15 g = £17.50, 60 g = £50.00

Dermatix® (Meda)

Silicone gel, 15 g = £19.38, 60 g = £58.14

Kelo-cote® (ABT Healthcare)

Silicone gel, 15 g = £17.88, 60 g = £51.00

Silicone spray, 100 mL = £51.00

ScarSil® (Jobskin)

Silicone gel, 30 g = £10.00

Silgel® STC-SE (Nagor)

Silicone gel, 20-mL tube = £19.00

A8.5 Adjunct dressings and appliances

A8.5.1 Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate ('strike through') with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, section A8.2.7). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous (section A.8.2.4), foam (section A8.2.5), or alginate (section A8.2.6)) layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP

Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls, 25 g = 71p; 100 g = £1.61; 500 g = £5.43 (most suppliers).

Drug Tariff specifies 25-g pack to be supplied when weight not stated

Absorbent Cotton, Hospital Quality

As for absorbent cotton but lower quality materials, shorter staple length etc. 100 g = £1.12; 500 g = £3.54 (most suppliers)

Drug Tariff specifies to be supplied only where specifically ordered

Note Not suitable for wound cleansing

Gauze and tissue

Absorbent Cotton Gauze, BP 1988

Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.06; 3 m = £2.22; 5 m = £3.46; 10 m = £6.62 (most suppliers). 1-m packet supplied when no size stated

Note Drug Tariff also includes unsterilised absorbent cotton gauze, 25 m roll = £14.93

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988

Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile. 5 m (both) × 1.25 cm = 79p; 2.5 cm = 87p

Gauze and Cotton Tissue, BP 1988

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £6.89 (most suppliers, including Robinsons—*Gamgee Tissue*® (blue label))

Gauze and Cotton Tissue

(Drug Tariff specification 14). Similar to above. 500 g = £5.03 (most suppliers, including Robinsons—*Gamgee Tissue*® (pink label))

Drug Tariff specifies to be supplied only where specifically ordered

Lint

Absorbent Lint, BPC

Cotton cloth of plain weave with nap raised on one side from warp yarns. 25 g = 88p; 100 g = £2.69; 500 g = £11.32 (most suppliers).

Drug Tariff specifies 25-g pack supplied where no quantity stated

Note Not recommended for wound management

Pads

Absorbent Dressing Pads, Sterile

Drisorb®, 10 cm × 20 cm = 17p (Synergy Healthcare)

PremierPad®, 10 cm × 20 cm = 18p, 20 cm × 20 cm = 25p (Shermond)

Xupad®, 10 cm × 20 cm = 17p, 20 cm × 20 cm = 28p, 20 cm × 40 cm = 40p (Richardson)

[1] **Surgipad®** (Systagenix) NHS

Absorbent pad of absorbent cotton and viscose in sleeve of non-woven viscose fabric, pouch 12 cm × 10 cm = 18p, 20 cm × 10 cm = 25p, 20 cm × 20 cm = 30p, 40 cm × 20 cm = 41p; *non sterile* pack 12 cm × 10 cm = 5p, 20 cm × 10 cm = 10p, 20 cm × 20 cm = 17p, 40 cm × 20 cm = 28p

1. NHS Except in Sterile Dressing Pack with Non-woven Pads

A8.5.2 Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol® (Braun)

Draina S Fistula, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.44; medium (cut to 50 mm), 350-mL capacity = £3.64; large (cut to 88 mm), 500-mL capacity = £4.48

Draina S Vision, wound drainage pouch, (cut to 50 mm), 150-mL capacity = £9.39; (cut to 88 mm), 250-mL capacity = £9.92; (cut to 100 mm), 300-mL capacity = £11.51

Dermasure® (ADI Medical)

Pouch, small (wound size up to 9 cm × 16 cm) = £15.60; medium (wound size up to 15 cm × 27 cm) = £20.80

Eakin® (Eakin)

Wound pouch, *fold and tuck closure*, small (wound size up to 45 mm × 30 mm) = £4.50; medium (wound size up to 110 mm × 75 mm) = £6.50; large (wound size up to 175 mm × 110 mm) = £8.50; extra large (horizontal wound up to 245 mm × 160 mm) = £15.00

Wound pouch, *bung closure*, small (wound size up to 45 mm × 30 mm) = £5.00; medium (wound size up to 110 mm × 75 mm) = £7.00; large (wound size up to 175 mm × 110 mm) = £9.50; extra large (horizontal or vertical wound up to 245 mm × 160 mm) = £17.00, (vertical incision wound up to 290 mm × 130 mm) = £17.00; (horizontal wound up to 245 mm × 160 mm), *with access window* = £19.00

Access window, for use with *Eakin*® pouches = £7.00

Oakmed® Option (OakMed)

Wound Manager, extra small (wound size up to 90 mm × 180 mm) = £11.00; small (horizontal wound size up to 245 mm × 160 mm) = £12.23; medium (vertical wound size up to 90 mm × 260 mm) = £12.50; large (wound size up to 160 mm × 260 mm) = £14.90; square (vertical wound up to 160 mm × 200 mm) = £13.05

Wound Manager, *with access port*, extra small (wound size up to 90 mm × 180 mm) = £12.02; small (horizontal wound size up to 245 mm × 160 mm) = £12.77; medium (vertical wound size up to 90 mm × 260 mm) = £13.05; large (wound size up to 160 mm × 260 mm) = £15.93; square (vertical wound size up to 160 mm × 200 mm) = £13.59

Wound Manager, *cut-to-fit*, small (10–30 mm) = £2.25, medium (10–50 mm) = £2.49, large (10–50 mm) = £2.61

Welland® (CliniMed)

Fistula bag, wound manager, *cut-to-fit* (wound size up to 40 mm × 70 mm) = £2.54

Wound Drainage Collector (Hollister)

Pouch, drainable, small (wound size up to 76 mm) = £7.45, medium (wound size up to 95 mm) = £8.13, large (wound size up to 100 mm × 200 mm) = £16.10

A8.6 Complex adjunct therapies

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots), and growth factors such as becalpermin (see section 13.11.7).

A8.6.1 Topical negative pressure therapy

Vacuum assisted closure products

Exsu-Fast® (Synergy Healthcare)

Dressing kit, Kit 1 (small wound, low exudate) = £28.04; Kit 2 (large wound, heavy exudate) = £35.83; Kit 3 (large wound, medium to low exudate) = £35.83; Kit 4 (small wound, heavy exudate) = £28.04

Renasys® F/P (S&N Hlth.)

Dressing kit, foam dressing with round drain (plus port, drapes and fixation film), small = £19.15, medium = £22.25, large = £26.39, extra large = £45.28

Renasys® G (S&N Hlth.)

Dressing kit, non-adherent gauze and transparent film dressing, with flat drain, small = £16.64, medium = £20.86, large = £26.48; round drain, small = £16.64, large = £26.48; channel drain, medium = £20.86

V.A.C.® (KCI Medical)

GranuFoam® dressing kit, polyurethane foam dressing (with adhesive drapes and pad connector), 10 cm × 7.5 cm × 3.3 cm (small) = £21.73, 18 cm × 12.5 cm × 3.3 cm (medium) = £25.87, 26 cm × 15 cm × 3.3 cm (large) = £30.01; bridge dressing kit (for diabetic foot wound) = £30.10; *with silver*, small = £31.50, medium = £36.54

Simplace® dressing kit, spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector), small = £24.99, medium = £28.73

WhiteFoam®, polyvinyl alcohol foam dressing 10 cm × 7.5 cm (small) = £10.00, 10 cm × 15 cm (large) = £16.01; dressing kit (with adhesive drape and pad connector), 10 cm × 7.5 cm (small) = £24.34, 10 cm × 15 cm (large) = £31.51

Venturi® (Talley)

Wound sealing kit, flat drain, standard = £15.00, large = £17.50; channel drain = £15.00

V1STA® (S&N Hlth.)

Dressing kit, flat drain, small = £16.98, medium = £21.27, large = £27.01; round drain, small = £16.98, large = £27.01; channel drain, medium = £21.27

WoundASSIST® (Huntleigh)

Wound pack, small–medium = £20.81, medium–large = £23.85, extra large = £34.05; channel drain, small–medium = £20.81, medium–large = £23.85

Wound drainage collection devices

ActiV.A.C.® (KCI Medical)

Canister (with gel), 300 mL = £26.91

Renasys® Go (S&N Hlth.)

Canister kit (with solidifier), 300 mL = £18.77, 750 mL = £25.88

S-Canister® (S&N Hlth.)

Canister kit, 250 mL (with solidifier) = £19.00

V.A.C Freedom® (KCI Medical)

Canister (with gel), 300 mL = £26.71

Venturi® (Talley)

Canister kit, (with solidifier) = £12.50; *Compact* canister kit (with solidifier) = £12.50

V1STA® (S&N Hlth.)

Canister kit, 250 mL (with solidifier) = £19.15, 800 mL (with solidifier) = £21.27

WoundASSIST® (Huntleigh)

Canister, 500 mL = £20.30

Accessories

Renasys® (S&N Hlth.)

Port for foam dressing = £9.31, Y-connector = £3.10

V.A.C.® (KCI Medical)

Drape = £8.82. Gel for canister = £3.53. Sensa T.R.A.C. pad = £10.29. T.R.A.C. Y-connector = £2.94

Venturi® (Talley)

Gel patches, adhesive, pack of 5 = £15.00. Y-connector, pack of 5 = £15.00

WoundASSIST® (Huntleigh)

Gel strip = £3.37

A8.7 Wound care acccessories

A8.7.1 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

Multiple Pack Dressing No. 1

(Drug Tariff). Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded). 1 pack = £4.02

Non-Drug Tariff Specification Sterile Dressing Pack

Dressit® contains vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field = 60p (Richardson)

Nurse It® contains powder-free vinyl gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, plastic forceps = 52p (Medicare)

Polyfield® Nitrile Patient Pack contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Propax® SDP contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 45p (BSN Medical)

Woundcare® contains nitrile gloves, sterile field, compartmented tray, large apron, disposable bag, non-woven swabs, drape = 44p (Frontier)

Sterile Dressing Pack

(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 50p (Synergy Healthcare—*Vernaid®*)

Sterile Dressing Pack with Non-woven Pads

(Drug Tariff specification 35). Contains non-woven fabric covered dressing pad, non-woven fabric swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 49p (Synergy Healthcare—*Vernaid®*)

A8.7.2 Woven and fabric swabs

Gauze Swab, BP 1988

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 38p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.34 (most suppliers)

Filmated Gauze Swab, BP 1988

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.60 (Synergy Healthcare—*Cotfil®*)

Non-woven Fabric Swab

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 25p; non-sterile, 10 cm × 10 cm, 100-pad packet = 78p

Filmated Non-woven Fabric Swab

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.55 (Systagenix—*Regal®*)

A8.7.3 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Permeable adhesive tapes

Elastic Adhesive Tape, BP 1988

(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.68 (S&N—*Elastoplast®*)

For 5 cm width, see Elastic Adhesive Bandage

Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988

Non-woven fabric with a polyacrylate adhesive.

Hypafix®, 5 cm × 5 m = £1.34, 10 cm × 5 m = £2.25, 10 m (all): 2.5 cm = £1.56, 5 cm = £2.48, 10 cm = £4.33, 15 cm = £6.42, 20 cm = £8.51, 30 cm = £12.31 (BSN Medical)

Mefix®, 5 m (all): 2.5 cm = 98p, 5 cm = £1.72; 10 cm = £2.76, 15 cm = £3.76, 20 cm = £4.82, 30 cm = £6.91 (Mölnlycke)

Omnifix®, 10 m (all): 5 cm = £2.24, 10 cm = £3.77, 15 cm = £5.57 (Hartmann)

Primafix®, 5 cm × 10 m = £1.50, 10 cm × 10 m = £2.20, 15 cm × 10 m = £3.25, 20 cm × 10 m = £4.00 (S&N Hlth.)

Permeable Non-woven Synthetic Adhesive Tape, BP 1988

Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:

Clinipore®, 5 m (all) 1.25 cm = 35p, 2.5 cm = 59p, 5 cm = 99p; 2.5 cm × 10 m = 73p (Clinisupplies)

Leukofix®, 5 m (all) 1.25 cm = 52p, 2.5 cm = 83p, 5 cm = £1.45 (BSN Medical)

Leukopor®, 5 m (all) 1.25 cm = 46p, 2.5 cm = 72p, 5 cm = £1.26 (BSN Medical)

Mediplast®, 5 m (all) 1.25 cm = 30p, 2.5 cm = 50p (Neomedic)

Micropore®, 5 m (all) 1.25 cm = 60p, 2.5 cm = 89p, 5 cm = £1.57 (3M)

Scanpor®, 5 m (all) 1.25 cm = 40p, 2.5 cm = 65p, 5 cm = £1.12; 10 m (all), 1.25 cm = 52p, 2.5 cm = 87p, 5 cm = £1.65, 7.5 cm = £2.42 (BioDiagnostics)

Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm)

Permeable Woven Synthetic Adhesive Tape, BP 1988

Non-extensible closely woven fabric, spread with a polymeric adhesive. 5 m (all): 1.25 cm = 78p; 2.5 cm = £1.15; 5 cm = £1.99 (Beiersdorf—*Leukosilk®*)

Silicone adhesive tape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Insil®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Insight)

Mepitac®, 2 cm × 3 m = £6.56, 4 cm × 1.5 m = £6.56 (Mölnlycke)

Siltape®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Advancis)

Zinc Oxide Adhesive Tape, BP 1988

(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm = 95p; 2.5 cm = £1.38; 5 cm = £2.33; 7.5 cm = £3.51 (most suppliers)

Zinc Oxide Adhesive Tape

Mediplast®, 5 m (all), 1.25 cm = 82p, 2.5 cm = £1.19, 5 cm = £1.99, 7.5 cm = £2.99 (Neomedic)

Strappal®, 5 m (all): 1.25 cm = 89p, 2.5 cm = £1.29, 5 cm = £2.17, 7.5 cm = £3.27 (BSN Medical)

Occlusive adhesive tapes

Impermeable Plastic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with an adhesive mass. 2.5 cm × 3 m = £1.33; 2.5 cm × 5 m = £1.99; 5 cm × 5 m = £2.53; 7.5 cm × 5 m = £3.67 (BSN Medical—*Sleek®*)

Impermeable Plastic Synthetic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 5 m (both): 2.5 cm = £1.72; 5 cm = £3.27 (3M—*Blenderm®*)

A8.7.4 Adhesive dressings

Adhesive dressings (also termed 'island dressings') have a limited role for minor wounds only. The inclusion of an antiseptic is not particularly useful and may cause skin irritation in susceptible subjects.

Vapour permeable adhesive dressings

Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993

(former Drug Tariff title: Semipermeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of semi-permeable waterproof surgical adhesive tape, to leave suitable adhesive margin; both pad and margin covered with suitable protector.(S&N Hlth—*Elastoplast Airstrip®*)

A8.7.5 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip®, 6.4 mm × 76 mm, 3 strips per envelope. 10 envelopes = £5.95 (S&N Hlth.)

Omnistrip®, 6 mm × 76 mm, 3 strips per envelope. 50 envelopes = £22.50 (Hartmann)

Steri-strip®, 6 mm × 75 mm, 3 strips per envelope. 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber

A8.8 Bandages

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

A8.8.1 Non-extensible bandages

Bandages made from non-extensible, woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

Open-wove Bandage, Type 1 BP 1988

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length. 5 m (all): 2.5 cm = 31p; 5 cm = 52p; 7.5 cm = 74p; 10 cm = 96p (most suppliers)

Triangular Calico Bandage, BP 1980

Unbleached calico right-angled triangle, 90 cm × 90 cm × 1.27 m = £1.15 (most suppliers)

A8.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of **conforming-stretch bandages** (also termed contour bandages) is greater than that of **cotton conforming bandages**.

Conforming Bandage (Synthetic)

Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):

Hospiform®, 6 cm = 13p, 8 cm = 16p, 10 cm = 18p, 12 cm = 22p (Hartmann)

Cotton Conforming Bandage, BP 1988

Cotton fabric, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all): type A, 5 cm = 63p, 7.5 cm = 77p, 10 cm = 96p, 15 cm = £1.30 (BSN Medical—*Easifix Crinx®*)

Knitted Polyamide and Cellulose Contour Bandage, BP 1988

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):

Easifix K®, 2.5 cm = 9p, 5 cm = 10p, 7.5 cm = 15p, 10 cm = 17p, 15 cm = 30p (BSN Medical)

K-Band®, 5 cm = 19p, 7 cm = 24p, 10 cm = 27p, 15 cm = 47p (Urgo)

Knit-Band®, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)

Knit Fix®, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

Polyamide and Cellulose Contour Bandage

Peha-haft®, cohesive, latex-free, 4 m (all) 2.5 cm = 68p, 4 cm = 44p, 6 cm = 52p, 8 cm = 62p, 10 cm = 71p, 12 cm = 84p (Hartmann)

PremierBand®, 4 m (all); 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Shermond)

Polyamide and Cellulose Contour Bandage, BP 1988 (Nylon and Viscose Stretch Bandage)

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):

Acti-Wrap®, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)

Easifix®, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 47p, 15 cm = 80p (BSN Medical)

Kontour®, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)

Mollelast®, latex-free, 4 cm = 28p, 6 cm = 34p (Activa)

Slinky®, 7.5 cm = 57p, 10 cm = 68p, 15 cm = 98p (Mölnlycke)

Stayform®, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

A8.8.3 Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

Compression hosiery (section A8.9.1) reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

Silk clothing is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).

Elasticated

Elasticated Surgical Tubular Stockinette, Foam padded

(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £2.86, medium = £3.09, large = £3.30; sacral, medium, and large (all) = £14.76 (Medlock—*Tubipad®*)

Uses relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface

Elasticated Tubular Bandage, BP 1993

(formerly Elasticated Surgical Tubular Stockinette). Knitted fabric, elasticated threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn, tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm; Synergy—*Comfigrip®*; Easigrip—*EasiGRIP®*; Sallis—*Eesiban®*; Medlock—*Tubigrip®*. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage.

Acti-Fast®, 3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15 (Activa)

CliniFast®, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83; *vest (long-sleeved)*, 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; *vest (short-sleeved)*, adult, small = £12.50, medium = £14.25, large = £16.25; *tights (pair)* 6–24 months = £7.13; *leggings (pair)* 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; *cycle shorts*, adult, small = £12.50, medium = £14.25, large = £16.25; *socks (pair)* up to 8 years = £2.97, 8–14 years = £2.97; *mittens (pair)* up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; *gloves*, child, small, medium, large = £4.99, adult, small, medium, large = £4.99; *clava*, 6 months–5 years = £5.85, 5–14 years = £6.75 (Clinisupplies)

Comfifast®, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83 (Synergy)

Comfifast® Easy Wrap, *vest (long-sleeved)*, 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.75, medium = £14.54, large = £16.58; *tights (pair)*, 6–24 months = £7.13; *leggings (pair)*, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.75, medium = £14.54, large = £16.58; *socks (pair)*, up to 8 years = £2.97, 8–14 = £2.97; *mittens (pair)*, up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; *clava*, 6 months–5 years = £5.85, 5–14 years = £6.75 (Synergy)

Comfifast® Multistretch, 3.5 cm red line (small limb), length 1 m = 72p; 5 cm green line (medium limb), length 1 m = 78p, 3 m = £2.23, 5 m = £3.82; 7.5 cm blue line (large limb), length 1 m = £1.05, 3 m = £2.93, 5 m = £5.12; 10.75 cm yellow line (child trunk), length 1 m = £1.67, 3 m = £4.78, 5 m = £8.21; 17.5 cm beige line (adult trunk), length 1 m = £2.49 (Synergy Healthcare)

Coverflex®, 3.5 cm red line (small limb), length 1 m = 76p; 5 cm green line (medium limb), length 1 m = 80p, 3 m = £2.34, 5 m = £4.03; 7.5 cm blue line (large limb), length 1 m = £1.11, 3 m = £2.65, 5 m = £5.25; 10.75 cm yellow line (child trunk), length 1 m = £1.75, 3 m = £5.04, 5 m = £8.86; 17.5 cm beige line (adult trunk), length 1 m = £2.34 (Hartmann)

Easifast®, 3.5 cm red line (small limb), length 1 m = 65p; 5 cm green line (medium limb), length 1 m = 69p, 3 m = £1.95, 5 m = £3.40; 7.5 cm blue line (large limb), length 1 m = 94p, 3 m = £2.60, 5 m = £4.50; 10.75 cm yellow line (child trunk), length 1 m = £1.50, 3 m = £4.25, 5 m = £7.20; 17.5 cm beige line (adult trunk), length 1 m = £1.90 (Easigrip)

Skinnies®, *body-suit*, premature, 0–3 months, or 3–6 months = £15.90, 6–12 months = £17.90; *clava*, 6 months–5 years = £6.62, 5–14 years = £7.60; *gloves* child (small) = £5.20, (medium or large) = £5.25, adult (small) = £5.20, (medium or large) = £5.25; *leggings (pair)*, 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; *mittens*, 0–24 months, 2–8 years, or 8–14 years = £3.80; *socks, ankle (pair)*, 6 months–8 years or 8–14 years = £4.20; *socks, knee (pair)*, child (small, medium, or large, up to shoe size 4) = £13.70, adult (shoe size 4–6, 6–8, 8–11, or size 11+) = £13.70; *vest (long-sleeved)*, 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; *vest (short-sleeved)*, 6–24 months = £10.20, 2–5 years = £13.40, 5–8 years = £15.10, 8–11 years or 11–14 years = £16.80, adult (small) = £20.80, (medium) = £22.70, (large) = £24.60; *vest (sleeveless)*, 6–24 months = £10.20, 2–5 years = £13.40, 5–8 years = £15.15, 8–11 years = £16.80, 11–14 years = £16.80, adult (small) = £20.80, (medium) = £22.70, (large) = £24.60 (Skinnies)

Tubifast® 2-way stretch, 3.5 cm red line (small limb), length 1 m = 88p; 5 cm green line (medium limb), length 1 m = 95p, 3 m = £2.70, 5 m = £4.61; 7.5 cm blue line (large limb), length 1 m = £1.26, 3 m = £3.55, 5 m = £6.19; 10.75 cm yellow line (child trunk), length 1 m = £2.02, 3 m = £5.78, 5 m = £9.92; 20 cm purple line (large adult trunk), length 1 m = £3.27, 5 m = £16.00; *vest (long-sleeved)*, 6–24 months = £10.97, 2–5 years = £14.63, 5–8 years = £16.46, 8–11 years = £18.28, 11–14 years = £18.28; *tights (pair)*, 6–24 months = £10.97; *leggings (pair)*, 2–5 years = £14.63, 5–8 years = £16.46, 8–11 years = £18.28, 11–14 years = £18.28; *socks (pair)*, one-size = £4.58; *gloves*, (small-medium or medium-large adult, extra small or small child) = £5.50 (Mölnlycke)

Non-elasticated

Cotton Stockinette, Bleached, BP 1988

Knitted fabric, cotton yarn, tubular length, 1 m (all), 2.5 cm = 34p; 5 cm = 53p; 7.5 cm = 63p; 6 m × 10 cm = £4.32 (J&J, Medlock)

Uses 1 m lengths, basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage

Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988

Knitted fabric of 1:1 ribbed structure, singles yarn spun from blend of two-thirds cotton and one-third viscose fibres, tubular. Length 5 m (all):

Type A (lightweight): arm/leg (child), arm (adult) 5 cm = £2.45; arm (OS adult), leg (adult) 7.5 cm = £3.22; leg (OS adult) 10 cm = £4.27; trunk (child) 15 cm = £6.15; trunk (adult) 20 cm = £7.11; trunk (OS adult) 25 cm = £8.50 (Mölnlycke)

Type B (heavyweight): sizes as for Type A, net price £2.30–£7.97 (Sallis—*Eesiban®*)

Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage

Uses protective dressings with tar-based and other non-steroid ointments

Silk Clothing

Knitted, medical grade silk clothing can be used as an adjunct to normal treatment for severe eczema and allergic skin conditions. When used in combination with medical creams and ointments, care should be taken to ensure that the medication is fully absorbed into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with emollients used in 'wet wrapping techniques'.

DermaSilk® (Espere)

Knitted silk fabric, hypoallergenic, sericin-free, *body suit*, child 0–3 months (height 62 cm) = £36.18, 3–6 months (height 68 cm) = £35.65, 6–9 months (height 74 cm) = £36.67, 9–12 months (height 74 cm) = 38.25, 12–18 months (height 86 cm) = £36.69, 18–24 months (height 92 cm) = £39.29, 2–3 years (height 98 cm) = £38.71, 3–4 years (height 110 cm) = £39.73; *boxer shorts*, adult (male), small–XXXL =£39.95; *briefs*, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 10–12 years = £20.95, adult (female), small–XXL = £29.39; *facial mask*, child (head circumference up to 47 cm) = £15.30, child (head circumference up to 50 cm) = £15.30, teen or adult = £20.19; *gloves*, adult (small, medium, large, or extra large) = £19.33, child (small or medium) = £13.98; *leggings*, child 0–3 months (height 62 cm) = £25.83, 3–6 months (height 68 cm) = £25.45, 6–9 months (height 74 cm) = £26.47, 9–12 months (height 74 cm) = £27.90, 12–18 months (height 86 cm) = £27.49, 18–24 months (height 92 cm) = £28.94, 2–3 years (height 98 cm) = £28.51, 3–4 years (height 110 cm) = £29.53, adult (male), small–XXL = £75.60, adult (female), small–XXL = £75.60; *pyjamas*, child 3–4 years (height 110 cm) = £66.25, 5–6 years (height 120 cm) = £70.33, 7–8 years (height 135 cm) = £73.39, 10–12 years (height 150 cm) = £76.45; *shirt, roll-neck*, 3–4 years = £45.56, 5–6 years = £48.49, 7–8 years = £50.51, 10–12 years = £52.54, adult, small–XXL = £74.72; *shirt, round-neck*, adult (male), small–XXL = £74.72, adult (female), small–XXL = £74.72; *sleeves (tubular)*, length 33 cm = £25.45, 50 cm = £32.50; *undersocks, (heel-less)*, 2 pairs standard or longer

length = £22.95; *undersocks*, adult shoe-size 5½–6½, 7–8½, 9–10½, 11–13, child shoe-size 3–8, 9–1, 2–5, 2 pairs = £17.45

DreamSkin® (Dreamskin)

Knitted silk fabric, hypoallergenic, sericin-free, with methyacrylate copolymer and zinc-based antibacterial, *body suit (with foldaway mitts)*, child up to 6 months = £35.65, 6–9 months = £36.67, 9–12 months = £37.20, 12–18 months = £37.69, 2–3 years = £38.71, 3–4 years = £39.73; *briefs or fitted boxers*, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 9–10 years = £20.95, 11–12 years = £20.95, adult (male) small–XXL = £32.95, adult (female) small–XXL = £30.95; *eye mask*, one size = £9.95; *gloves*, child (small or medium) = £13.98, adult (small, medium, large, or extra large) = £19.62; *head mask*, child up to 1 year (head circumference 39–45cm) = £15.30, child 1–8 years (head circumference 48–50cm) = £15.30, child 12–18 years = £19.96, adult = £19.96; *leggings (with foldaway feet)*, child up to 6 months = £25.45, 6–9 months = £26.47, 9–12 months = £26.98, 12–18 months = £27.49, 2–3 years = £28.51, 3–4 years = £29.53; *leggings (without feet; male or female styles)*, 3–4 years = £29.53, 5–6 years = £30.99, 7–8 years = £31.49, 9–10 years = £31.99, 11–12 years = £32.49, adult small–XXL = £74.74; *pyjamas (male* or *female styles)*, 3–4 years = £66.25, 5–6 years = £70.33, 7–8 years = £73.39, 9–10 years = £74.95, 11–12 years = £76.45; *shirt, polo-neck, long-sleeved (male or female styles)*, 3–4 years = £44.94, 5–6 years = £47.94, 7–8 years = £49.94, 9– 10 years = £50.94, 11–12 years = £51.94, adult small–XXL = £73.87; *shirt, round-neck, long-sleeved (male* or *female styles)*, 3–4 years = £44.95, 5–6 years = £46.95, 7–8 years = £48.95, 9–10 years = £49.95, 11–12 years = £50.95, adult small–XXL = £73.87; *sleeves, (tubular)*, pair, length 33 cm = £25.83, 50 cm = £32.13; *tights*, adult (female) small–XL = £22.95; *undersocks, (liner socks)*, 2 pairs, child shoe-size 3–5½, 6–8½, 9–12, 12½–3½, 4–5½, = £17.58, adult (male) shoe-size 6–8½, 9–11 = £17.58, adult (female) shoe-size 4–5½, 6–8½ = £17.58; *undersocks (heel-less)*, one size = £23.12

A8.8.4 Support bandages

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A8.8.7.

Crepe Bandage, BP 1988

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 92p; 7.5 cm = £1.29; 10 cm = £1.68; 15 cm = £2.44 (most suppliers)

Cotton Crepe Bandage

Light support bandage, 4.5 m stretched (all): 5 cm = 48p; 7.5 cm = 67p; 10 cm = 87p; 15 cm = £1.27 (Steraid—*Hospicrepe® 239*)

Cotton Crepe Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.88; 10 cm = £3.70 (most suppliers)

Cotton, Polyamide and Elastane Bandage

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Hospilite®, 5 cm = 34p, 7.5 cm = 47p, 10 cm = 57p, 15 cm = 84p (Hartmann)

Neosport®, 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Neomedic)

Profore® #2, 10 cm = £1.27, latex-free = £1.35 (S&N Hlth)

Setocrepe®, 10 cm = £1.13 (Mölnlycke)

Soffcrepe®, 5 cm = 64p, 7.5 cm = 91p, 10 cm = £1.16, 15 cm = £1.67 (BSN Medical)

Cotton Stretch Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all):

Hospicrepe® 233, 5 cm = 52p; 7.5 cm = 72p; 10 cm = 96p; 15 cm = £1.36 (Steraid)

PremierBand®, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p, 15 cm = £1.18 (Shermond)

Cotton Suspensory Bandage

(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.59, extra large = £1.68. Type 2: cotton net bag with elastic edge and webbing waistband; small = £1.76, medium = £1.81, large = £1.88, extra large = £1.95. Type 3: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.90; extra large = £1.96. Type supplied to be endorsed

Knitted Elastomer and Viscose Bandage

Knitted fabric, viscose and elastomer yarn.

Type 2 (light support bandage)

CliniLite®, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 80p, 15 cm = £1.16 (Clinisupplies)

K-Lite®, 4.5 m stretched, 5 cm = 52p, 7 cm = 73p, 10 cm = 95p, 15 cm = £1.38; 5.2 m stretched, 10 cm = £1.09 (Urgo)

Knit-Firm®, 4.5 m stretched, 5 cm = 36p, 7 cm = 51p, 10 cm = 66p, 15 cm = 96p (Steraid)

Type 3a (light compression bandage):

CliniPlus®, 8.7 m × 10 cm = £1.80 (Clinisupplies)

Elset®, 6 m stretched, 10 cm = £2.46, 15 cm = £2.66; 8 m stretched, 10 cm = £3.14; 12 m stretched, 15 cm = £5.27 (Mölnlycke)

K-Plus®, 8.7 m stretched, 10 cm = £2.14; long, 10.25 m stretched, 10 cm = £2.47 (Urgo)

Profore® #3, 8.7 m stretched, 10 cm = £3.70, latex-free = £4.02 (S&N Hlth.)

L3, 8.6 m stretched, 10 cm = £2.07 (S&N Hlth.)

A8.8.5 Adhesive bandages

Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with **zinc paste bandage** in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all): 5 cm = £3.39; 7.5 cm = £4.90; 10 cm = £6.52 (BSN Medical—*Elastoplast®* Bandage).

Drug Tariff specifies 7.5 cm width supplied when size not stated

A8.8.6 Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as

an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages

Coban® (3M)

Bandage, 6 m (stretched), 10 cm = £2.76

K-Press® (Urgo)

Bandage, 6.5 m × 10 cm (0, short) = £2.78; 7.5 m, 18–25 cm ankle circumference, 8 cm = £3.06, 10 cm = £3.25, 12 cm = £4.09; 10.5 m, 25–32 cm ankle circumference, 8 cm = £3.33, 10 cm = £3.55, 12 cm = £4.48

Profore® #4 (S&N Hlth.)

Bandage, 2.5 m (unstretched) = £3.06, latex-free = £3.32

Ultra Fast® (Robinsons)

Bandage, 6.3 m (stretched), 10 cm = £2.59

A8.8.7 Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

High compression bandages

PEC High Compression Bandage

Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched, 10 cm = £3.34 (Mölnlycke—*Setopress®*)

VEC High Compression Bandage

Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both); 7.5 cm = £2.53; 10 cm = £3.25 (S&N—*Tensopress®*)

High Compression Bandage

Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched), 10 cm = £3.42 (ConvaTec— *SurePress®*); 3 m (unstretched), 10 cm = £2.66 (Urgo—*K-ThreeC®*); 3.5 m (unstretched), 10 cm = £1.82 (Advancis—*Adva-Co®*)

ProGuide® #2 (S&N Hlth.)

Woven, elastomer, cohesive, extensible, compression bandage, 3 m (unstretched), 10 cm (red) = £5.51, 10 cm (yellow) = £6.02, 10 cm (green) = £6.52

Short stretch compression bandage

Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (*see* Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

Actiban® (Activa)

Bandage, 5 m (all), 8 cm = £3.16; 10 cm = £3.40; 12 cm = £4.14

Actico® (Activa)

Bandage, cohesive, 6 m (all), 4 cm = £2.25, 6 cm = £2.64, 8 cm = £3.03, 10 cm = £3.15, 12 cm = £4.02

Comprilan® (BSN Medical)

Bandage, 5 m (all), 6 cm = £2.52; 8 cm = £2.96; 10 cm = £3.18; 12 cm = £3.87

Rosidal K® (Activa)

Bandage, 5 m (all), 4cm = £1.76, 6cm = £2.45, 8 cm = £2.93, 10 cm = £3.20, 12 cm = £3.88; 10m x 10cm = £5.57

Silkolan® (Urgo)

Bandage, 5 m (all), 8 cm = £3.00; 10 cm = £3.39

Sub-compression wadding bandage

Advasoft® (Advancis)

Padding, 3.5 m unstretched, 10 cm = 37p

Cellona® Undercast Padding (Activa)

Padding, 2.75 m unstretched (all): 5 cm = 29p, 7.5 cm = 35p; 10 cm = 43p; 15 cm = 55p

Coban® 2 Comfort Layer (3M)

Padding, 2.7 m unstretched, 10 cm = £5.50

Flexi-Ban® (Activa)

Padding, 3.5 m unstretched, 10cm = 47p

K-Soft® (Urgo)

Padding, absorbent, 3.5 m unstretched, 10 cm = 43p; 4.5 m unstretched, 10 cm = 53p

K-Tech® (Urgo)

Padding, 5 m × 10 cm (0, short) = £3.76; 6 m, 18–25 cm ankle circumference, 8 cm = £4.26, 10 cm = £4.51, 12 cm = £5.69; 7.3 m, 25–32 cm ankle circumference, 8 cm = £4.64, 10 cm = £4.92, 12 cm = £6.21

Ortho-Band Plus® (Steraid)

Padding, 10 cm × 3.5 cm unstretched = 37p

Profore® #1 (S&N Hlth.)

Padding, viscose fleece, 3.5 m unstretched, 10 cm = 66p, latex-free = 72p

ProGuide® #1 (S&N Hlth.)

Padding, polyester and viscose fleece, 4 m unstretched, 10 cm = £1.53

Softexe® (Mölnlycke)

Padding, absorbent, 3.5 m unstretched, 10 cm = 60p

SurePress® (ConvaTec)

Padding, absorbent, 3 m unstretched, 10 cm = 56p

Ultra Soft® (Robinsons)

Padding, absorbent, 3.5 m unstretched, 10 cm = 39p

Velband® (BSN Medical)

Padding, absorbent, 4.5 m unstretched, 10 cm = 67p

A8.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A8.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems

K-Four® (Urgo)

K-Four® # 1 (*K-Soft®*—see Sub-compression Wadding Bandage, above); *K-Four®* # 2 (*K-Lite®*—see Knitted Elastomer and Viscose Bandage, p. 953); *K-Four®* # 3 (*K-Plus®*—see Knitted Elastomer and Viscose Bandage, p. 953); *K-Three C®*—see High compression bandages, above; *K-Four®* # 4 (*Ko-Flex®*), 6 m (stretched), 10 cm = £2.84; 7 m (stretched), 10 cm = £3.25

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.73, 18–25 cm = £6.44, 25–30 cm = £6.44, above 30 cm = £8.87; *reduced compression*, 18 cm and above = £4.21

Profore® (S&N Hlth.)

Profore® wound contact layer (see Knitted Viscose Primary Dressing, p. 937); *Profore® #1* (see Sub-compression Wadding Bandage, p. 954); *Profore® #2* (see Cotton, Polyamide and Elastane Bandage, p. 953); *Profore® #3* (see Knitted Elastomer and Viscose Bandage, p. 953); *Profore® #4* (see Cohesive bandages, p. 954); *Profore® Plus* 3 m (unstretched), 10 cm = £3.46, latex-free = £3.70

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £9.58, 18–25 cm = £8.92, 25–30 cm = £7.41, above 30 cm = £11.09, latex-free, 18–25 cm = £9.53; *Profore Lite®* above 18 cm = £5.15, latex-free = £5.60

System 4® (Mölnlycke)

System 4® #1 (*Softexe®*—see Sub-compression Wadding Bandage, p. 954); *System 4® #2* (*Setocrepe®*—see Cotton, Polyamide and Elastane Bandage, p. 953); *System 4® #3* (*Elset®*—see Knitted Elastomer and Viscose Bandage, p. 953); *System 4® #4* (*Meban®*)

Multi-layer compression bandaging kit, four layer system, for ankle circumference 18–25 cm = £7.46

Ultra Four® (Robinsons)

Ultra Four® #1 (*Ultra Soft®*—see Sub-compression Wadding Bandage, p. 954); *Ultra Four® #2* (*Ultra Lite®*) 10 cm × 4.5 cm (stretched) = 85p; *Ultra Four® #3* (*Ultra Plus®*) 10 cm × 8.7 cm (stretched) = £1.89; *Ultra Four® #4* (*Ultra Fast®*—see Cohesive Bandages, p. 954)

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.41, 18–25 cm = £5.67; *Ultra Four® RC* (reduced compression) 18–25 cm = £4.14

Two layer systems

Coban® 2 (3M)

Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08; *Coban® 2 Lite* (reduced compression), one size = £8.08

K-Two® (Urgo)

K-Tech® (see Sub-compression Wadding Bandages, p. 954); *K-Press®* (see Cohesive Bandages, p. 954)

Multi-layer compression bandaging kit, two layer system, size 0 (short) = £6.55; 18–25 cm ankle circumference, 8 cm = £7.32, 10 cm = £7.76, 12 cm = £9.78; 25–32 cm ankle circumference, 8 cm = £7.96, 10 cm = £8.48, 12 cm = £10.69

K-Two® Start, *Urgotul® Start* (see Protease-modulating matrix, p. 947); *K-Tech®* (see Sub-compression Wadding Bandages, p. 954); *K-Press®* (see Cohesive Bandages, p. 954)

Multi-layer compression bandaging kit, two-layer system, for ankle circumference 18–25cm = £9.68; 25–32cm = £10.33

ProGuide® (S&N Hlth.)

ProGuide® wound contact layer (see Absorbent dressings, p. 937); *ProGuide®* #1 (see Sub-compression Wadding Bandage, p. 954); *ProGuide®* #2 (see High Compression Bandages, p. 954)

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–22 cm (red) = £9.23; 22–28 cm (yellow) = £9.75; 28–32 cm (green) = £10.24

A8.8.9 Medicated bandages

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with **coal tar** or **ichthammol** in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with **calamine** in milder eczematous skin conditions.

Zinc Paste Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m × 7.5 cm = £3.44 (S&N Hlth.—*Viscopaste PB7®* (10%), *excipients: include* cetostearyl alcohol, hydroxybenzoates)

Zinc Paste and Ichthammol Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.47 S&N Hlth.—*Ichthopaste®* (6/2%), *excipients: include* cetostearyl alcohol

Uses see section 13.5

Steripaste® (Mölnlycke)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

Excipients include polysorbate 80

Medicated stocking

Zipzoc® (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30

Note Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

A8.9 Compression hosiery and garments

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A8.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Note Graduated compression tights are NHS

Compression values for hosiery and lymphoedema garments

Compression class	Compression hosiery (British standard)	Lymphoedema garments (European classification)
Class 1	14–17 mmHg	18–21 mmHg
Class 2	18–24 mmHg	23–32 mmHg
Class 3	25–35 mmHg	34–46 mmHg
Class 4	Not available	49–70 mmHg
Class 4 super	Not available	60–90 mmHg

A8.9.1 Graduated compression hosiery

Class 1 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.61, below knee = £6.95, (made-to-measure), thigh length = £37.79, below knee = £23.64; lightweight elastic net (made-to-measure), thigh length = £20.38, below knee = £15.91

Uses superficial or early varices, varicosis during pregnancy

Class 2 Medium Support

Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.31, below knee = £10.16, (made-to-measure), thigh length = £37.79, below knee = £23.64; net (made-to-measure), thigh length = £20.38, below knee = £15.91; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £37.79, below knee = £23.64

Uses varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

Class 3 Strong Support

Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.40, below knee = £11.52, (made-to-measure) thigh length = £37.79, below knee = £23.64; flat bed (made-to-measure, only with open heel and open toe), thigh length = £37.79, below knee = £23.64

Uses gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

Accessories

In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

Suspender

Suspender, for thigh stockings = 66p, belt (specification 13), = £4.99, fitted (additional price) = 62p

Anklets

Class 2 Medium Support

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84; net (made-to-measure) = £13.09

Class 3 Strong Support

Anklets, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.29, (made-to-measure) = £13.84

Knee caps

Class 2 Medium Support

Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84; net (made-to-measure) = £10.87

Class 3 Strong Support

Kneecaps, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.88; flat bed (standard) = £8.88, (made-to-measure) = £13.84

A8.9.2 Lymphoedema garments

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mm Hg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details.

Note There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 955.

A9 Cautionary and advisory labels for dispensed medicines

Numbers following the preparation entries in the BNF correspond to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

Original packs Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard . . . days after opening' and 'Do not use after . . . .', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF 61 (March 2011) a revised set of advisory and cautionary labels has been introduced. All of the existing labels have been user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

1 Warning: This medicine may make you sleepy
To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

To be used on *preparations for adults that can cause drowsiness*, thereby affecting the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs*.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3).

Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.

Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision, dizziness, or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

To be used on *preparations containing monoamine-oxidase inhibitors*; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol while taking this medicine

To be used on *preparations where a reaction such as flushing may occur if alcohol is taken* (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as ketoconazole *where the absorption is significantly affected by antacids*; the usual period of avoidance recommended is 2 hours.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on *preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine*. These drugs chelate calcium, iron and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. These incompatible preparations should be taken 2 hours apart.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on *preparations containing ciprofloxacin, norfloxacin or tetracyclines that chelate calcium, iron, magnesium, and zinc* and are thus less available for absorption; these incompatible preparations should be taken 2 hours apart. Doxycycline, lymecycline and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

To be used on *preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit* (e.g. antituberculous drugs).

Also to be used on *preparations that contain a drug whose withdrawal is likely to be a particular hazard* (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

To be used on *preparations where a course of treatment should be completed* to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

To be used particularly on *preparations containing anticoagulants, lithium and oral corticosteroids*. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright cloudy day. Do not use sunbeds

To be used on *preparations that may cause phototoxic or photoallergic reactions* if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 9 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

To be used on *preparations containing probenecid and sulfinpyrazone* whose activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

To be used on *preparations that are intended to be dissolved in water* (e.g. soluble tablets) or *mixed with water* (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless

To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine

To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening

To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours

To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be

specified, e.g. tablets or capsules.
It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions (e.g. nitrazepam in epilepsy) when hypnotics are prescribed for daytime administration this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) *for anxiolytics prescribed to be taken at night*.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.

21 Take with or just after food, or a meal
To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*.
Patients should be advised that a *small amount of food is sufficient*.

22 Take 30 to 60 minutes before food
To be used on some preparations *whose absorption is thereby improved*.
Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
To be used on *oral preparations whose absorption may be reduced by the presence of food and acid in the stomach*.

24 Suck or chew this medicine
To be used on *preparations that should be sucked or chewed*.
The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or break
To be used on *preparations that are enteric-coated or designed for modified-release*.
Also to be used on *preparations that taste very unpleasant or may damage the mouth* if not swallowed whole.

26 Dissolve this medicine under your tongue
To be used on *preparations designed for sublingual use*. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
To be used on *preparations that should be well diluted* (e.g. chloral hydrate), *where a high fluid intake is required* (e.g. sulphonamides), or *where water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.
This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine
To be used on all containers of dispensed *preparations containing paracetamol*.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

Products and their labels

Pazopanib, 23, 25
PecFent, 2, C, administration, see BNF
Penbritin, 9, 23
Penicillamine, 6, 22, C, blood disorder symptoms, see BNF
Pentasa tabs and gran, C, administration, blood disorder symptoms, see BNF
Pentasa enema and supps, C, blood disorder symptoms, see BNF
Pentazocine caps and tabs, 2, 21
Pentoxifylline m/r, 21, 25
Peppermint oil caps, 5, 22, 25
Percutol, C, administration, see BNF
Pergolide, 10, C, driving, see BNF
Periactin, 2
Pericyazine, 2
Perindopril, 22
Periostat, 6, 11, 27, C, posture, see BNF
Permethrin dermal cream, 10, patient information leaflet
Perphenazine, 2
Persantin, 22
Persantin Retard, 21, 25
Pethidine, 2
Phenelzine, 3, 10, patient information leaflet
Phenergan, 2
Phenindione, 10, anticoagulant card, 14, (urine pink or orange)
Phenobarbital elixir and tabs, 2, 8, C, driving, see BNF

Phenoxymethylpenicillin, 9, 23
Phenytoin caps and tabs, 8, C, administration, blood or skin disorder symptoms, driving, see BNF
Phenytoin chewable tabs, 8, 24, C, blood or skin disorder symptoms, driving, see BNF
Phenytoin susp, 8, C, administration, blood or skin disorder symptoms, driving, see BNF
Phosex, C, do not chew, with meals
PhosLo, C, with meals
Phosphate-Sandoz, 13
Phyllocontin Continus, 25
Physeptone, 2
Physiotens, 3
Picolax, 10, patient information leaflet, 13, C, solution, see BNF
Pilocarpine tabs, 21, 27, C, driving
Pimecrolimus, 4, 28
Pimozide, 2
Pindolol, 8
Piperazine powder, 13
Piracetam, 3
Piriton, 2
Piroxicam caps and tabs, 21
Piroxicam dispersible tabs, 13, 21
Pivmecillinam, 9, 21, 27, C, posture, see BNF
Pizotifen, 2
Plaquenil, 5, 21
Plendil, 25
Podophyllin paint cpd, 15, C, application, see BNF
Ponstan, 21
Posaconazole, 3, 9, 21
Potaba caps, 21
Potaba Envules, 13, 21
Potassium chloride m/r, see preps
Potassium citrate mixt, 27
Potassium effervescent tabs, 13, 21
Pradaxa, 25
Pramipexole, 10, C, driving, see BNF
Pramipexole m/r, 10, 25, C, driving, see BNF
Pravastatin, C, muscle effects, see BNF
Praxilene, 25, 27
Prazosin, C, initial dose, driving, see BNF
Prednisolone inj, 10, steroid card
Prednisolone tabs, 10, steroid card, 21
Prednisolone e/c, 5, 10, steroid card, 25
Prednisone m/r, 10, steroid card, 21, 25
Pregabalin, 3, 8, C, driving
Preservex, 21
Prestim, 8
Prezista, 21, C, missed dose, see BNF
Priadel liq, 10, lithium card, C, fluid and salt intake, see BNF
Priadel tabs, 10, lithium card, 25, C, fluid and salt intake, see BNF
Primidone, 2, 8, C, driving, see BNF
Pripsen, 13
Pro-Banthine, 23
Probenecid, 12, 21, 27
Procarbazine, 4
Prochlorperazine, 2
Prochlorperazine buccal tabs, 2, C, administration, see BNF
Procyclidine, C, driving
Progesterone (micronised), C, administration, see BNF
Prograf, 23, C, driving, see BNF
Proguanil, 21, C, malaria prophylaxis, see BNF
Progynova TS preps, C, administration, see BNF
Promazine, 2
Promethazine, 2
Propafenone, 21, 25, C, driving
Propantheline, 23
Propiverine hydrochloride, 3
Propiverine hydrochloride m/r, 3, 25
Propranolol oral solution and tabs, 8
Propranolol m/r, 8, 25
Protelos, 5, 13, C, administration, see BNF
Prothiaden, 2
Protopic, 4, 11, 28
Prozac, C, driving, see BNF
Psorin, 28
Pulmicort, 8, C, administration; with high doses, 10, steroid card
Pulmicort Respules, 8, 10, steroid card, C, dose
Pyrazinamide, 8

Questran preps, 13, C, avoid other drugs at same time, see BNF
Quetiapine, 2
Quetiapine m/r, 2, 23, 25
Quinagolide, 10, 21, C, driving, see BNF
Qvar preps, 8, C, administration; with high doses, 10, steroid card

Rabeprazole, 25
Raltegravir, 25
Ranexa, 25, patient alert card
Ranitidine effervescent tabs, 13
Ranolazine, 25, patient alert card
Rapamune, C, administration
Rasilez, 21
Rebetol, 21
Reboxetine, C, driving
Regulan, 13, C, administration, see BNF
Regurin, 23
Regurin XL, 23, 25
Relifex, 21
Relifex susp, 21
Relpax, 3
Remedeine, 2, 29, 30
Remicade, 10, Alert card, C, tuberculosis and hypersensitivity reactions
Reminyl, 3, 21
Reminyl XL, 3, 21, 25
Renagel, 25, C, with meals
Renvela sachets, 13, C, with meals
Renvela tabs, 25, C, with meals
Requip, 10, 21, C, driving, see BNF
Requip XL, 10, 25, C, driving, see BNF
Resonium A, 13
Restandol, 21, 25
Retapamulin, 28
Retin A, 11
Retrovir oral solution, C, use of oral syringe
Revlimid, 25, C, symptoms of thromboembolism, neutropenia, or thrombocytopenia, patient information leaflet
Revolade, C, other drugs, see BNF
Reyataz, 5, 21
Rhumalgan, 5, 25
Riamet, 21, C, driving
Ribavirin caps, tabs, and solution, 21
Rifabutin, 8, 14, (urine orange-red), C, soft lenses
Rifadin, 8, 14, (urine orange-red), 22, C, soft lenses
Rifampicin caps and syrup, 8, 14, (urine orange-red), 22, C, soft lenses
Rifater, 8, 14, (urine orange-red), 22, C, soft lenses
Rifinah, 8, 14, (urine orange-red), 22, C, soft lenses
Rilutek, C, blood disorders, driving
Rimactane, 8, 14, (urine orange-red), 22, C, soft lenses
Risedronate sodium, C, administration, food and calcium, see BNF
Risperdal liquid, 2, C, use of dose syringe
Risperdal orodispersible tabs, 2, C, administration, see BNF
Risperdal tabs, 2
Risperidone liquid, 2, C, use of dose syringe
Risperidone orodispersible tabs, 2, C, administration, see BNF
Risperidone tabs, 2
Ritonavir oral solution, 21, C, administration, see BNF
Ritonavir tabs, 21, 25
Rivastigmine, 21, 25
Rivotril, 2, 8, C, driving, see BNF
Rizatriptan tabs, 3
Rizatriptan wafers, 3, C, administration

Roaccutane, 10, patient information leaflet, 11, 21
RoActemra, alert card, C, diverticular perforation, infection, see BNF
Robaxin, 2
Roflumilast, C, patient card
Romiplostim, C, driving
Ropinirole, 10, 21, C, driving, see BNF
Ropinirole m/r, 10, 25, C, driving, see BNF
Rosuvastatin, C, muscle effects, see BNF
Rotigotine, 10, C, driving
Rowachol, 22
Rowatinex caps, 25
Rufinamide, 21, C, driving, see BNF

Rupatadine, C, driving
Rythmodan Retard, 25

Sabril sachets, 3, 8, 13, C, driving, see BNF
Sabril tabs, 3, 8, C, driving, see BNF
Salactol, 15
Salagen, 21, 27, C, driving
Salamol Easi-Breathe, C, administration
Salatac, 15
Salazopyrin, 14, (urine orange-yellow), C, blood disorder symptoms and soft lenses, see BNF
Salazopyrin EN-tabs, 5, 14, (urine orange-yellow), 25, C, blood disorder symptoms and soft lenses, see BNF
Salbulin Novolizer, C, administration
Salbutamol inhalations, C, administration
Salbutamol m/r, 25
Salicylic acid collodion, 15
Salmeterol, C, administration
Salofalk enema and supps, C, blood disorder symptoms, see BNF
Salofalk gran, 25, C, administration, blood disorder symptoms, see BNF
Salofalk tabs, 5, 25, C, blood disorder symptoms, see BNF
Sandrena, C, administration, see BNF
Sando-K, 13, 21
Sandocal, 13
Sandocal +D preps, 13
Sanomigran, 2
Sapropterin, 13, 21, C, administration, see BNF
Saquinavir, 21, C, arrythmias
Sativex, C, driving, see BNF
Scopoderm TTS, 19, C, administration, see BNF
Sebivo, C, muscle effects
Sebomin MR, 6, 25
Sectral, 8
Securon SR, 25
Selegiline (freeze-dried tablets), C, administration, see BNF
Selexid, 9, 21, 27, C, posture, see BNF
Septrin susp and tabs, 9
Seractil, 21
Serc, 21
Serenace, 2
Seretide, 8, 10, steroid card (250- and 500-*Accuhaler* only), C, administration
Seretide Evohaler, 8, C, administration, 10, steroid card (125- and 250-*Evohaler* only)
Serevent, C, administration
Seroquel, 2
Seroquel XL, 2, 23, 25
Seroxat tabs, 21, C, driving
Seroxat susp, 5, 21, C, driving
Sertraline, C, driving, see BNF
Sevelamer carbonate sachets, 13, C, with meals
Sevelamer carbonate tabs, 25, C, with meals
Sevelamer hydrochloride, 25, C, with meals
Sevredol, 2
Simeticone, see paediatric prep
Simponi, 10, Alert card, C, tuberculosis, blood disorders
Simvastatin, C, muscle effects, see BNF
Sinemet CR, 10, 14, (urine reddish), 25, C, driving, see BNF
Sinemet, 10, 14, (urine reddish), C, driving, see BNF
Sinepin, 2
Singulair chewable tabs, 23, 24
Sinthrome, 10, anticoagulant card
Sirolimus, C, administration
Skelid, C, food and calcium
Slo-Phyllin, 25 or C, administration, see BNF
Sloprolol, 8, 25
Slow Sodium, 25
Slow-Fe, 25
Slow-Fe Folic, 25
Slow-K, 25, 27, C, posture, see BNF
Slow-Trasicor, 8, 25
Slozem, 25
Sodium aurothiomalate, 11, C, blood disorder symptoms, see BNF
Sodium chloride m/r, 25
Sodium chloride and glucose oral pdr, cpd, 13
Sodium clodronate, C, food and calcium, see BNF
Sodium cromoglicate (oral), 22, C, administration, see BNF
Sodium cromoglicate inhalation, 8, C, administration
Sodium fusidate susp, 9, 21
Sodium fusidate tabs, 9
Sodium picosulfate pdr, 10, patient information leaflet, 13, C, see BNF
Sodium valproate e/c, 5, 8, 25, C, blood or hepatic disorder symptoms, driving, see BNF
Sodium valproate m/r and granules, 8, 21, 25, C, blood or hepatic disorder symptoms, driving, see BNF
Sodium valproate crushable tabs, liquid and syrup, 8, 21, C, blood or hepatic disorder symptoms, driving, see BNF
Solian, 2
Solifenacin, 3
Soliris, C, meningococcal infection, patient information card
Solpadol caps and caplets, 2, 29, 30
Solpadol Effervescent, 2, 13, 29, 30
Solu-Cortef, 10, steroid card
Solu-Medrone, 10, steroid card
Solvazinc, 13, 21
Somnite, 19
Sonata, 2
Sorafenib, 23
Sotacor, 8
Sotalol, 8
Spiriva inhalations, C, administration
Spironolactone, 21
Sporanox caps, 5, 9, 21, 25, C, hepatotoxicity
Sporanox liq, 9, 23, C, administration, hepatotoxicity
Sprycel, 25
Stalevo, 10, 14, (urine reddish-brown), C, driving, see BNF
Stavudine, 23
Stelara, 10, C, tuberculosis, see BNF

Zyvox susp and tabs, 9, 10, patient information leaflet

Dental Practitioners' Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Sugar-free versions, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Ampicillin Capsules, BP
Ampicillin Oral Suspension, BP
Artificial Saliva Oral Spray, DPF
[1]Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):
AS Saliva Orthana®
Glandosane®
Biotene Oralbalance®
BioXtra®
Saliveze®
Salivix®
[2]Aspirin Tablets, Dispersible, BP
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulite®
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Carmellose Gelatin Paste, DPF
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Hydrochloride Tablets, 10 mg, DPF
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%, DPF
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, BP
Dihydrocodeine Tablets, BP, 30 mg
Dispersible Doxycycline Tablets, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, DPF
Lidocaine 5% Ointment, DPF
Lidocaine Spray 10%, DPF
Loratadine Tablets, 10 mg, DPF
[3]Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Mouthwash Solution-tablets, DPF
Nitrazepam Tablets, BP
Nystatin Oral Suspension, BP
Gastro-resistant Omeprazole Capsules, BP
Oxytetracycline Tablets, BP
[4]Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Penciclovir Cream, DPF
Phenoxymethylpenicillin Oral Solution, BP
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
3. This preparation does not appear in subsequent editions of the BP
4. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed

Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, below

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.

Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder PoM
amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Oral Spray
(proprietary product: *Xerotin*) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Azithromycin Oral Suspension 200 mg/5 mL PoM
azithromycin 200 mg/5 mL when reconstituted with water

Betamethasone Soluble Tablets 500 micrograms PoM
(proprietary product: *Betnesol Soluble Tablets*), betamethasone (as sodium phosphate) 500 micrograms

Carmellose Gelatin Paste
(proprietary product: *Orabase Oral Paste*), gelatin, pectin, carmellose sodium, 16.58% of each in a suitable basis

Cetirizine Hydrochloride Tablets
cetirizine hydrochloride 10 mg

Chlorhexidine Oral Spray
(proprietary product: *Corsodyl Oral Spray*), chlorhexidine gluconate 0.2%

Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%
(proprietary product: *Periogard Oromucosal Solution*), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL PoM
clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL PoM
clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg PoM
(proprietary product: *Periostat*), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg PoM
fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL PoM
(proprietary product: *Diflucan*), fluconazole 50 mg/5 mL when reconstituted with water

Lansoprazole Capsules PoM
lansoprazole 15 mg and 30 mg capsules, enclosing e/c granules

Lidocaine 5% Ointment
lidocaine 5% in a suitable basis

Lidocaine Spray 10%
(proprietary product: *Xylocaine Spray*), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Tablets
loratadine 10 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes

Penciclovir Cream PoM
(proprietary product: *Vectavir Cream*), penciclovir 1%

Saliva Stimulating Tablets
(proprietary product: *SST*), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619% PoM
(proprietary product: *Duraphat '2800 ppm' Toothpaste*), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1% PoM
(proprietary product: *Duraphat '5000 ppm' Toothpaste*), sodium fluoride 1.1%

Changes to Dental Practitioners' Formulary since September 2010

Deletions
Artificial Saliva Liquid, DPF

Changes of title

Old	New
Co-amoxiclav Oral Suspension, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL, DPF	Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL, DPF	Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL

Nurse Prescribers' Formulary

Nurse Prescribers' Formulary for Community Practitioners

Nurse Prescribers' Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 975

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
[1] Aspirin Tablets, Dispersible, 300 mg, BP
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Chlorhexidine, NPF
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, 'Solution G', NPF
Catheter Maintenance Solution, 'Solution R', NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP

1. Max. 96 tablets; max. pack size 32 tablets

Emollients as listed below:
- Aquadrate® 10% w/w Cream
- Aqueous Cream, BP
- Arachis Oil, BP
- Balneum® Plus Cream
- Cetraben® Emollient Cream
- Dermamist®
- Diprobase® Cream
- Diprobase® Ointment
- Doublebase®
- E45® Cream
- E45® Itch Relief Cream
- Emulsifying Ointment, BP
- Eucerin® Intensive 10% w/w Urea Treatment Cream
- Eucerin® Intensive 10% w/w Urea Treatment Lotion
- Hydromol® Cream
- Hydromol® Intensive
- [2] Hydromol® Ointment
- Hydrous Ointment, BP
- Lipobase®
- Liquid and White Soft Paraffin Ointment, NPF
- Neutrogena® Norwegian Formula Dermatological Cream
- Nutraplus® Cream
- Oilatum® Cream
- Oilatum® Junior Cream
- Paraffin, White Soft, BP
- Paraffin, Yellow Soft, BP
- [2] QV® Cream
- [2] QV® Lotion
- QV® Wash
- Ultrabase®
- Unguentum M®
- [2] Zerobase® Cream
- [2] Zerocream®
- [2] Zeroguent® Cream

Emollient Bath Additives as listed below:
- [3] Balneum®
- [3] Balneum Plus® Bath Oil
- Cetraben® Emollient Bath Additive
- Dermalo® Bath Emollient
- Diprobath®
- Doublebase® Emollient Bath Additive
- Doublebase® Emollient Shower Gel
- Doublebase® Emollient Wash Gel
- Hydromol® Bath and Shower Emollient
- Oilatum® Emollient
- Oilatum® Junior Bath Additive
- Oilatum® Gel
- [2] QV® Bath Oil
- Zerolatum® Emollient Medicinal Bath Oil
- [2] Zeroneum® Bath Oil
- Zerozole® Bath Oil

2. Included in the Drug Tariff (Part IXA)
3. Except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)

Folic Acid 400 micrograms/5 mL Oral Solution, NPF
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
[1] Ibuprofen Oral Suspension, BP
[1] Ibuprofen Tablets, BP
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogol Oral Powder, Compound, NPF
Macrogol Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulphate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
[2] Paracetamol Tablets, BP
[2] Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets)
Permethrin Cream, NPF
Phosphate Suppositories, NPF
Phosphates Enema, BP
Piperazine and Senna Powder, NPF
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermicidal contraceptives as listed below:
Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Cream, BP
Zinc Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichthammol Bandage, BP 1993

1. Except for indications and doses that are PoM
2. Max. 96 tablets; max. pack size 32 tablets

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may **not** be prescribed by Nurses are annotated **Nx**.

Appliances (including Contraceptive Devices[3]) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff:
www.centralservicesagency.com/display/ni_drug_tariff
Scottish Drug Tariff:
www.isdscotland.org/isd/2245.html

Details of NPF preparations

Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema

arachis oil 100%

Catheter Maintenance Solution, Chlorhexidine

(proprietary product: *Uro-Tainer Chlorhexidine*), chlorhexidine 0.02%

Catheter Maintenance Solution, Sodium Chloride

(proprietary products: *OptiFlo S*; *Uro-Tainer Sodium Chloride*; *Uriflex-S*), sodium chloride 0.9%

Catheter Maintenance Solution, 'Solution G'

(proprietary products: *OptiFlo G*; *Uro-Tainer Suby G*; *Uriflex G*), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

3. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic

Catheter Maintenance Solution, 'Solution R'

(proprietary products: *OptiFlo R*; *Uro-Tainer Solution R*; *Uriflex R*), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions

(proprietary products: *ChloraPrep*; *Hydrex Solution*; *Hydrex spray*), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions

(proprietary product: *Unisept*) chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules PoM

co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg)

Co-danthramer Capsules, Strong PoM

co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg)

Co-danthramer Oral Suspension PoM

(proprietary product: *Codalax*), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong PoM

(proprietary product: *Codalax Forte*), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)

Co-danthrusate Oral Suspension PoM

(proprietary product: *Normax*), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams

(proprietary products: *Conotrane Cream*, dimeticone '350' 22%; *Siopel Barrier Cream*, dimeticone '1000' 10%; *Vasogen Barrier Cream*, dimeticone 20%), dimeticone 10–22%

Dimeticone Lotion

(proprietary product: *Hedrin*), dimeticone 4%

Docusate Enema

(proprietary product: *Norgalax Micro-enema*) docusate sodium 120 mg in 10 g

Folic Acid Oral Solution 400 micrograms/5 mL

(proprietary product: *Folicare*), folic acid 400 micrograms/5 mL

Liquid and White Soft Paraffin Ointment

liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Powder, Compound

macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet (proprietary products: *Movicol*; *Laxido*)

Note Amount of potassium chloride varies according to flavour of *Movicol*® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K^+ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength

(proprietary product: *Movicol-Half*), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions

(proprietary products: *Derbac-M Liquid*), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension PoM

(proprietary product: *Vermox*), mebendazole 100 mg/5 mL

[1] Mebendazole Tablets PoM

(proprietary products: *Ovex*, *Vermox*), mebendazole 100 mg

Mouthwash Solution-tablets

consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

[2] Nicotine Inhalation Cartridge for Oromucosal Use

(proprietary products: *Nicorette Inhalator*), nicotine 10 mg

Nicotine Lozenge

nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: *Nicotinell Mint Lozenge*) or nicotine (as polacrilex) 2 mg or 4 mg (proprietary product: *NiQuitin Lozenges*), or nicotine (as resinate complex) 1.5 mg (proprietary product: *Nicopass Lozenge*)

Nicotine Medicated Chewing Gum

(proprietary products: *Nicorette Gum*, *Nicotinell Gum*, *NiQuitin Gum*), nicotine 2 mg or 4 mg

Nicotine Nasal Spray

(proprietary product: *Nicorette Nasal Spray*), nicotine 500 micrograms/metered spray

[3] Nicotine Sublingual Tablets

(proprietary product: *Nicorette Microtab*), nicotine (as a cyclodextrin complex) 2 mg

[4] Nicotine Transdermal Patches

releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary product: *Boots NicAssist Patch*, *Nicorette Patch*) or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: *Nicopatch*, *Nicotinell TTS*, *NiQuitin*)

Permethrin Cream

(proprietary product: *Lyclear Dermal Cream*), permethrin 5%

Phosphate Suppositories

(proprietary product: *Carbalax*), sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g

Piperazine and Senna Powder

(proprietary product: *Pripsen Oral Powder*), piperazine phosphate 4 g, sennosides 15.3 mg/sachet

Senna Oral Solution

(proprietary product: *Senokot Syrup*), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules

(proprietary product: *Manevac Granules*), senna fruit 12.4%, ispaghula 54.2%

1. For PoM exemption, see p. 415
2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)
3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4. Prescriber should specify the brand to be dispensed

Sodium Citrate Compound Enema

(proprietary products: *Micolette Micro-enema*; *Micralax Micro-enema*; *Relaxit Micro-enema*), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules

(proprietary products: *Dulcolax Perles*), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir

(proprietary products: *Dulcolax Liquid*), sodium picosulfate 5 mg/5 mL

Sterculia Granules

(proprietary product: *Normacol Granules*), sterculia 62%

Sterculia and Frangula Granules

(proprietary product: *Normacol Plus Granules*), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray

(proprietary product: *Sprilon*), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage

(proprietary product: *Steripaste*), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking

(proprietary product: *Zipzoc*), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

Nurse Independent Prescribing

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition, including some Controlled Drugs (see below).

Nurse Independent Prescribers must work within their own level of professional competence and expertise. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Nurse Independent Prescribers are also able to prescribe independently the Controlled Drugs in the table below, *solely for the medical conditions indicated*.

For information on the mixing of medicines by Nurse Independent Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

Up-to-date information and guidance on nurse independent prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing

Controlled drugs prescribable by Nurse Independent Prescribers solely for the medical conditions indicated

Drug	Indication	Route of Administration
Buprenorphine	Transdermal use in palliative care	Transdermal
Chlordiazepoxide hydrochloride	Treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it	Oral
Codeine phosphate	–	Oral
Co-phenotrope	–	Oral
Diamorphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral
Diazepam	Use in palliative care, treatment of initial or acute withdrawal symptoms caused by the withdrawal of alcohol from persons habituated to it, tonic-clonic seizures	Oral, parenteral, rectal
Dihydrocodeine tartrate	–	Oral
Fentanyl	Transdermal use in palliative care	Transdermal
Lorazepam	Use in palliative care, tonic-clonic seizures	Oral, parenteral
Midazolam	Use in palliative care, tonic-clonic seizures	Parenteral, buccal
Morphine hydrochloride	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Rectal
Morphine sulphate	Use in palliative care, pain relief in respect of suspected myocardial infarction or for relief of acute or severe pain after trauma, including in either case postoperative pain relief	Oral, parenteral, rectal
Oxycodone hydrochloride	Use in palliative care	Oral, parenteral

Note For the purposes of nurse independent prescribing, palliative care means the care of patients with advanced, progressive illness

Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Up-to-date information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 4.

Nurses

For further information on Nurse Independent Prescribing, see Nurse Prescribers' Formulary, p. 977.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine, except Controlled Drugs, for any medical condition. Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see p. 988.

Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at http://tinyurl.com/cdslke

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Commercial Specials Manufacturers may also be able to provide further information about commercial companies (www.acsm.uk.com).

> The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

Yellowcard

It's easiest to report online at www.yellowcard.gov.uk

MHRA

COMMISSION ON HUMAN MEDICINES (CHM)

SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNF or www.yellowcard.gov.uk for guidance. Do not be put off reporting because some details are not known.

PATIENT DETAILS Patient Initials:_____ Sex: M / F Ethnicity:_____ Weight if known (kg):_____

Age (at time of reaction):_____ Identification number (e.g. Your Practice or Hospital Ref):_____

SUSPECTED DRUG(S)/VACCINE(S)

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for

SUSPECTED REACTION(S) Please describe the reaction(s) and any treatment given:

Outcome

Recovered ☐
Recovering ☐
Continuing ☐
Other ☐

Date reaction(s) started:_____ Date reaction(s) stopped: _____

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

Patient died due to reaction ☐
Life threatening ☐
Congenital abnormality ☐
Involved or prolonged inpatient hospitalisation ☐
Involved persistent or significant disability or incapacity ☐
Medically significant; please give details: _____

It's easiest to report online at www.yellowcard.gov.uk

OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for

Additional relevant information e.g. medical history, test results, known allergies, rechallenge (if performed), suspect drug interactions. For congenital abnormalities please state all other drugs taken during pregnancy and the last menstrual period.

Please list any medicines obtained from the internet:_____

REPORTER DETAILS

Name and Professional Address:_____

Postcode:_____ Tel No:_____
Email:_____
Speciality:_____
Signature:_____ Date:_____

CLINICIAN (if not the reporter)

Name and Professional Address:_____

Postcode:_____ Tel No:_____

Cardiovascular Risk Prediction Charts

Heart 2005; **91**(Suppl V): v1–v52

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have **not** already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should **not replace clinical judgment**.

- The use of these charts is **not appropriate** for patients who have existing diseases which already put them at high risk such as:

  - coronary heart disease or other major atherosclerotic disease;

  - familial hypercholesterolaemia or other inherited dyslipidaemias;

  - renal dysfunction including diabetic nephropathy;

  - type 1 and 2 diabetes mellitus.

- The charts should **not** be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should **not** be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.
- To estimate an individual's absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.
- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of $>$ 15% over the same period.
- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).
- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.
- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual's risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.
- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age of 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually $\geq$ 20% over 10 years and the charts will underestimate true total CVD risk.
- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with **untreated** levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.
- CVD risk is also higher than indicated in the charts for:

  - those with a family history of premature CVD (male first-degree relatives aged $<$ 55 years and female first-degree relatives aged $<$ 65 years) which increases the risk by a factor of approximately 1.5;

  - men with HDL cholesterol $<$ 1 mmol/litre or women with HDL cholesterol $<$ 1.2 mmol/ litre;

  - those with raised triglyceride levels ($>$ 1.7 mmol/litre);

  - those with BMI $\geq$ 30 kg/m^2;

  - women with premature menopause;

  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/ litre) or impaired glucose tolerance (2 hour glucose $\geq$ 7.8 mmol/litre but $<$ 11.1 mmol/ litre in an oral glucose tolerance test).

- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

(Continued over)

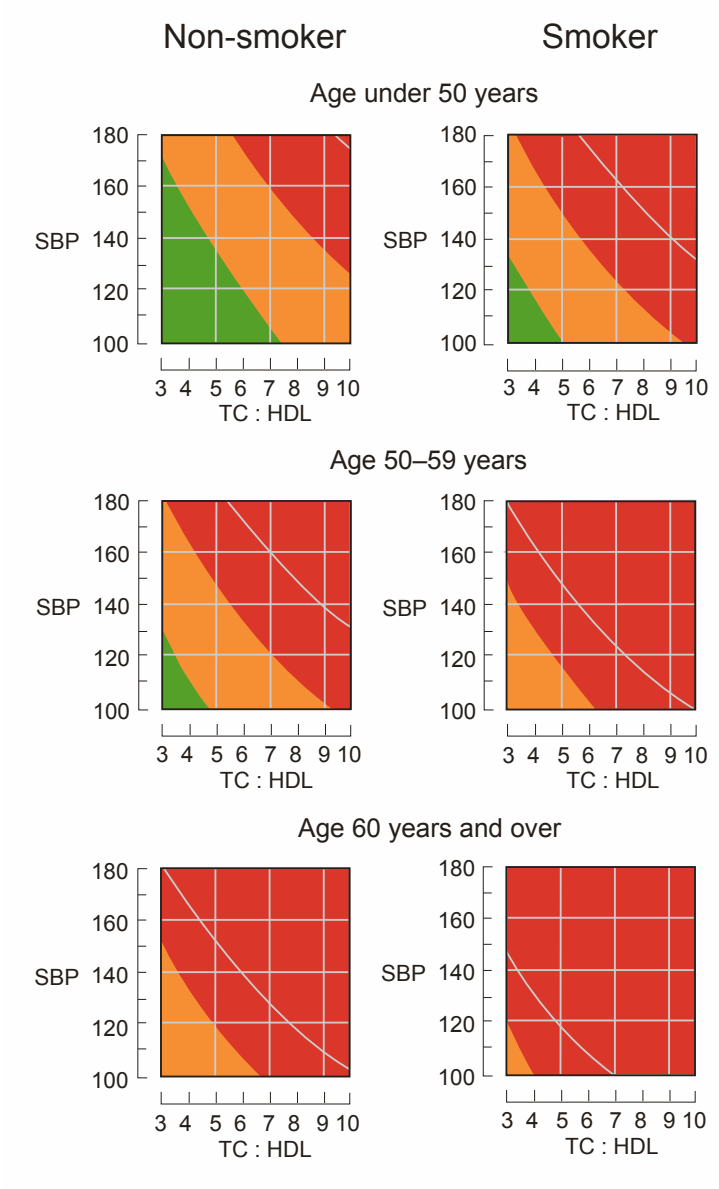
- An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): *Lipid modification–Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease* (available at www.nice.org.uk) differs from that shown here as follows:

- estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years)
- estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD
- estimated CVD risk for South Asian **men** is increased by a factor of 1.4
- CVD risk is higher than estimated in those with BMI $> 40\,kg/m^2$

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:

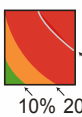


- presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

In February 2010, NICE withdrew the recommendation that the Framingham risk equation should be the equation of choice for assessment of CVD risk, but agreed that it should be considered as one of the possible equations to use.

(Continued over)

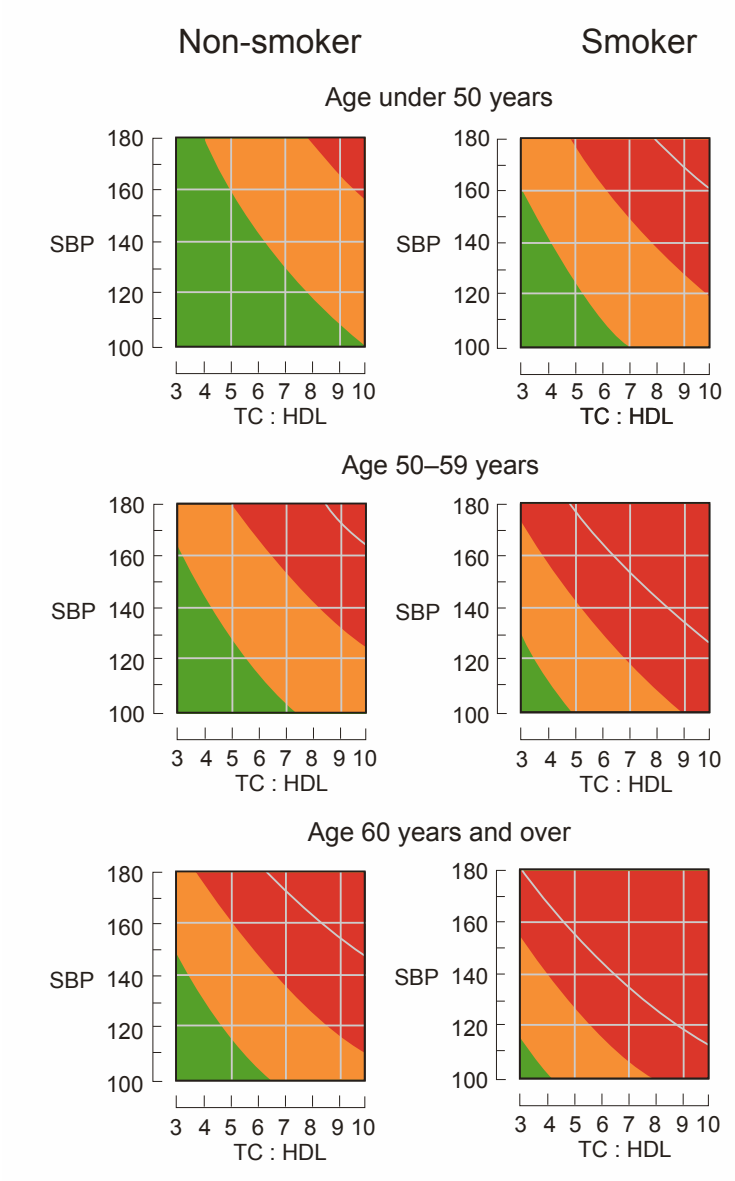


Nondiabetic Men

CVD risk <10% over next 10 years

CVD risk 10-20% over next 10 years

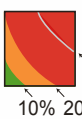
CVD risk >20% over next 10 years



SBP = systolic blood pressure mmHg

TC : HDL = serum total cholesterol to HDL cholesterol ratio

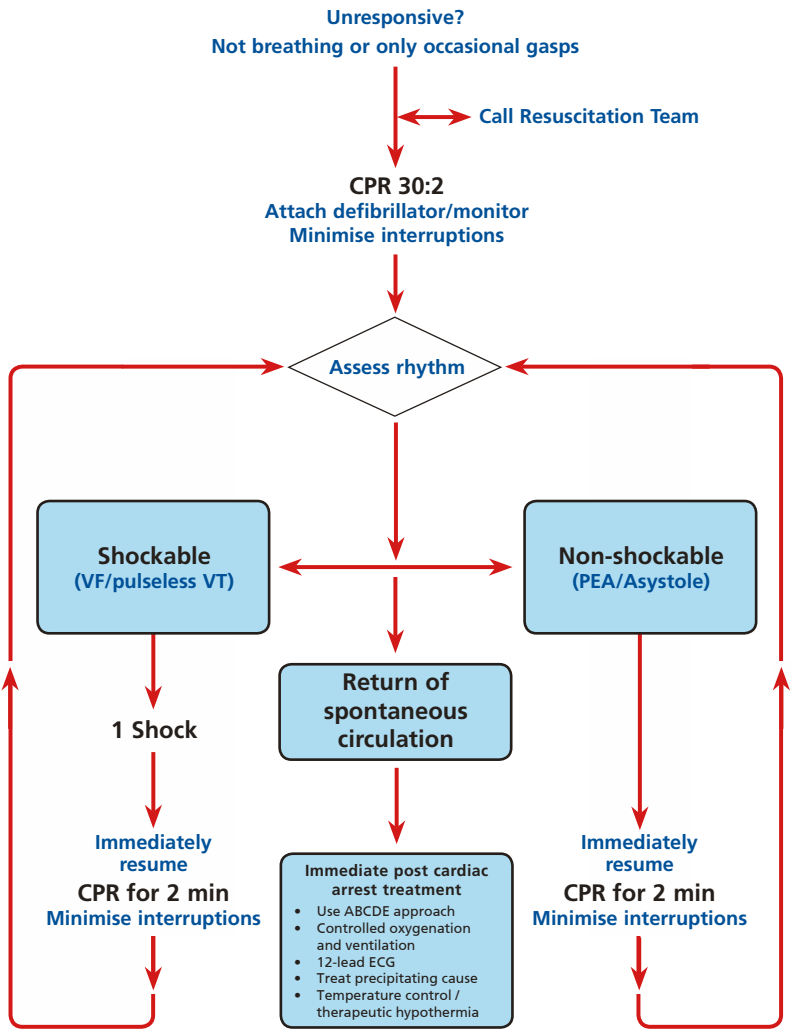
(Continued over)



Nondiabetic Women

CVD risk <10% over next 10 years

CVD risk 10-20% over next 10 years



CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio

© Central Manchester and Manchester Children's University Hospitals NHS Trust

ADULT ADVANCED LIFE SUPPORT ALGORITHM

During CPR

- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Correct reversible causes

Reversible causes

- Hypoxia
- Hypovolaemia
- Hypo- / hyperkalaemia / metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tamponade - cardiac
- Toxins
- Tension pneumothorax

Resuscitation Council (UK)

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, October 2010

Medical emergencies in the community

Drug treatment outlined below is intended for use by community healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient's condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Anaphylaxis

(section 3.4.3)

Adrenaline injection (1 mg/mL (1 in 1000))

- By intramuscular injection
  CHILD UNDER 6 YEARS 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  CHILD 6–12 YEARS 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  CHILD 12–18 YEARS 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if CHILD is small or prepubertal
  ADULT 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow **oxygen** (section 3.6) and **intravenous fluids** should be given as soon as available.

Chlorphenamine injection by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

Angina: unstable

(section 2.10.1)

Aspirin dispersible tablets (75 mg, 300 mg)

- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Plus

either **Glyceryl trinitrate aerosol spray** (400 micrograms/metered dose)

- Sublingually
  ADULT 1–2 sprays, repeated as required

or **Glyceryl trinitrate tablets** (300 micrograms, 500 micrograms, 600 micrograms)

- Sublingually
  ADULT 0.3–1 mg, repeated as required

Asthma: acute

(section 3.1)

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately **at any time** requires immediate transfer to hospital

Either **salbutamol aerosol inhaler** (100 micrograms/metered inhalation)

- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  ADULT and CHILD 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

or **salbutamol nebuliser solution** (1 mg/mL, 2 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 2.5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 2.5–5 mg every 20–30 minutes or as necessary
  ADULT 5 mg every 20–30 minutes or as necessary

or **terbutaline nebuliser solution** (2.5 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 5–10 mg every 20–30 minutes or as necessary
  ADULT 10 mg every 20–30 minutes or as necessary

Plus **(in all cases)**

either **prednisolone tablets (*or* prednisolone soluble tablets)** (5 mg)

- By mouth
  CHILD UNDER 12 YEARS 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  ADULT 40–50 mg once daily for 5 days

or **hydrocortisone (preferably as sodium succinate)**

- By intravenous injection
  CHILD UNDER 12 YEARS 4 mg/kg every 6 hours until conversion to oral prednisolone is possible; CHILD UNDER 2 YEARS max. 25 mg, 2–5 YEARS max. 50 mg, 6–12 YEARS max. 100 mg
  ADULT 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow **oxygen** (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta$_2$ agonist** (as above) and give with

ipratropium nebuliser solution (250 micrograms/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 12 YEARS 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  ADULT 500 micrograms every 4–6 hours as necessary

Convulsive (including febrile) seizures lasting longer than 5 minutes

(section 4.8.2 and section 4.8.3)

***Either* diazepam rectal solution** (2 mg/mL, 4 mg/mL)

- By rectum
  NEONATE 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
  CHILD 1 MONTH–2 YEARS 5 mg, repeated once after 10–15 minutes if necessary
  CHILD 2–12 YEARS 5–10 mg, repeated once after 10–15 minutes if necessary
  ADULT and CHILD OVER 12 YEARS 10–20 mg (ELDERLY 10 mg), repeated once after 10–15 minutes if necessary

***or* midazolam buccal liquid** (10 mg/mL) **or injection solution given by buccal route**

- By buccal administration, repeated once if necessary
  NEONATE 300 micrograms/kg
  CHILD 1–6 MONTHS 300 micrograms/kg (max. 2.5 mg)
  CHILD 6 MONTHS–1 YEAR 2.5 mg
  CHILD 1–5 YEARS 5 mg
  CHILD 5–10 YEARS 7.5 mg
  ADULT and CHILD OVER 10 YEARS 10 mg

Croup

(section 3.1)

Dexamethasone oral solution (2 mg/5 mL)

- By mouth
  CHILD 1 MONTH–2 YEARS 150 micrograms/kg as a single dose

Diabetic hypoglycaemia

(section 6.1.4)

Glucose or sucrose

- By mouth
  ADULT and CHILD OVER 2 YEARS approx. 10–20 g (55–110 mL *Lucozade® Energy Original or* 100–200 mL *Coca-Cola®*—both non-diet versions *or* 2–4 teaspoonfuls of sugar *or* 3–6 sugar lumps) repeated after 10–15 minutes if necessary

***or* if hypoglycaemia unresponsive *or* if oral route cannot be used**

Glucagon injection (1 mg/mL)

- By subcutaneous, intramuscular, or intravenous injection
  CHILD BODY-WEIGHT UNDER 25 KG 500 micrograms (0.5 mL)
  CHILD BODY-WEIGHT OVER 25 KG 1 mg (1 mL)
  ADULT 1 mg (1 mL)

***or* if hypoglycaemia prolonged *or* unresponsive to glucagon after 10 minutes**

Glucose intravenous infusion (10%)

- By intravenous injection into large vein
  CHILD 1 MONTH–18 YEARS 5 mL/kg (glucose 500 mg/kg)

Glucose intravenous infusion (20%)

- By intravenous injection into large vein
  ADULT 50 mL

Meningococcal disease

(Table 1, section 5.1)

Benzylpenicillin sodium injection (600 mg, 1.2 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 300 mg
  CHILD 1 MONTH–1 YEAR 300 mg
  CHILD 1–10 YEARS 600 mg
  CHILD 10–18 YEARS 1.2 g
  ADULT 1.2 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

***or* if history of allergy to penicillin**

Cefotaxime injection (1 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  NEONATE 50 mg/kg
  CHILD 1 MONTH–12 YEARS 50 mg/kg (max. 1 g)
  CHILD 12–18 YEARS 1 g
  ADULT 1 g

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

***or* if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, or urticarial reaction) to penicillin or to cephalosporins**

Chloramphenicol injection (1 g)

- By intravenous injection
  CHILD 1 MONTH–18 YEARS 12.5–25 mg/kg
  ADULT 12.5–25 mg/kg

Note A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

Myocardial infarction: ST-segment elevation

(section 2.10.1)

Aspirin dispersible tablets (75 mg, 300 mg)

- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Glyceryl trinitrate aerosol spray (400 micrograms/metered dose)

- Sublingually
  ADULT 1–2 sprays, repeated as required

***or* Glyceryl trinitrate tablets** (300 micrograms, 500 micrograms, 600 micrograms)

- Sublingually
  ADULT 0.3–1 mg, repeated as required

Metoclopramide injection (5 mg/mL)

- By intravenous injection
  ADULT (UNDER 60 KG) 18–19 YEARS 5 mg
  ADULT (OVER 60 KG) 18–19 YEARS 10 mg
  ADULT OVER 19 YEARS 10 mg

Diamorphine injection (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute) ADULT 5 mg followed by a further 2.5–5 mg if necessary; ELDERLY or FRAIL patients, reduce dose by half

or **Morphine sulphate injection** (10 mg/mL)

- By slow intravenous injection (1–2 mg/minute) ADULT 5–10 mg followed by a further 5–10 mg if necessary; ELDERLY or FRAIL patients, reduce dose by half

Oxygen, if appropriate

Myocardial infarction: non-ST-segment elevation

Treat as for *Angina: unstable*, above

Approximate conversions and units

lb	kg	stones	kg	mL	fl oz
1	0.45	1	6.35	50	1.8
2	0.91	2	12.70	100	3.5
3	1.36	3	19.05	150	5.3
4	1.81	4	25.40	200	7.0
5	2.27	5	31.75	500	17.6
6	2.72	6	38.10	1000	35.2
7	3.18	7	44.45		
8	3.63	8	50.80		
9	4.08	9	57.15		
10	4.54	10	63.50		
11	4.99	11	69.85		
12	5.44	12	76.20		
13	5.90	13	82.55		
14	6.35	14	88.90		
		15	95.25		

Length

1 metre (m)	= 1000 millimetres (mm)
1 centimetre (cm)	= 10 mm
1 inch (in)	= 25.4 mm
1 foot (ft)	= 12 inches
12 inches	= 304.8 mm

Mass

1 kilogram (kg)	= 1000 grams (g)
1 gram (g)	= 1000 milligrams (mg)
1 milligram (mg)	= 1000 micrograms
1 microgram	= 1000 nanograms
1 nanogram	= 1000 picograms

Volume

1 litre	= 1000 millilitres (mL)
1 millilitre (1 mL)	= 1000 microlitres
1 pint	≈ 568 mL

Other units

1 kilocalorie (kcal)	= 4186.8 joules (J)
1000 kilocalories (kcal)	= 4.1868 megajoules (MJ)
1 megajoule (MJ)	= 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg)	= 133.3 pascals (Pa)
1 kilopascal (kPa)	= 7.5 mmHg (pressure)

Plasma-drug concentrations in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height, and gender

The table below shows the **mean values** for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual's weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Age	Weight	Height
	kg	cm
Full-term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

Recommended wording of cautionary and advisory labels

For details see Appendix 9

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol while taking this medicine
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21. Take with or just after food, or a meal
22. Take 30 to 60 minutes before food
23. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24. Suck or chew this medicine
25. Swallow this medicine whole. Do not chew or break
26. Dissolve this medicine under your tongue
27. Take with a full glass of water
28. Spread thinly on the affected skin only
29. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine
32. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Abbreviations and symbols

Internationally recognised units and symbols are used in the BNF where possible.

ACBS	Advisory Committee on Borderline Substances, *see* Appendix 7
ACE	Angiotensin-converting enzyme
ADHD	Attention deficit hyperactivity disorder
AIDS	Acquired immunodeficiency syndrome
approx.	approximately
AV	atrioventricular
BAN	British Approved Name
BMI	body mass index
BP	British Pharmacopoeia 2010, unless otherwise stated
BPC	British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
CAPD	Continuous ambulatory peritoneal dialysis
CHM	Commission on Human Medicines
CHMP	Committee for Medicinal Products for Human Use
CNS	central nervous system
CPMP	Committee on Proprietary Medicinal Products
CRM	Committee on the Review of Medicines
CSM	Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.	direct current
DMARD	Disease-modifying antirheumatic drug
DPF	Dental Practitioners' Formulary
e/c	enteric-coated (termed gastro-resistant in BP)
ECG	electrocardiogram
EEG	electro-encephalogram
eGFR	estimated glomerular filtration rate, see Prescribing in renal impairment
f/c	film-coated
G6PD	glucose 6-phosphate dehydrogenase
HIV	Human immunodeficiency virus
HRT	Hormone replacement therapy
i/m	intramuscular
i/v	intravenous
INR	international normalised ratio
MAOI	Monoamine-oxidase inhibitor
max.	maximum
MCA	Medicines Control Agency, now MHRA
MHRA	Medicines and Healthcare products Regulatory Agency
m/r	modified-release
NCL	no cautionary labels, *see* Appendix 9
NHS	National Health Service

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t.i.d.	= ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102	Tartrazine	E223	Sodium Metabisulphite
E104	Quinoline Yellow	E320	Butylated Hydroxyanisole
E110	Sunset Yellow FCF	E321	Butylated Hydroxytoluene
E123	Amaranth	E322	Lecithins
E124	Ponceau 4R	E420	Sorbitol
E127	Erythrosine BS	E421	Mannitol
E132	Indigo Carmine	E422	Glycerol
E142	Green S	E901	Beeswax (white and yellow)
E171	Titanium Dioxide	E1520	Propylene Glycol
E172	Iron oxides, iron hydroxides		
E200	Sorbic Acid		
E211	Sodium Benzoate
